1. INTRODUCTION

This report was prepared by Geosyntec Consultants of NC, P.C. (Geosyntec) for The Chemours Company FC, LLC (Chemours) as the second semiannual report for Ongoing Sampling of the concentrations of per- and polyfluoroalkyl substances (“PFAS”) in process wastewater, non-process wastewater, and stormwater at the Chemours Fayetteville Works, North Carolina site (the Facility, Figure 1). This is the second semiannual report addressing paragraph 11(d) of the Consent Order amongst Chemours, the North Carolina Department of Environmental Quality (DEQ), and Cape Fear River Watch, entered into court on February 25, 2019.

This second semiannual report is a continuation of bimonthly sampling and quarterly reporting conducted under paragraph 11(c) of the Consent Order, which was an 18-month Initial Characterization of PFAS concentrations in the process wastewater, non-process wastewater, and stormwater at the Facility that is discharged through Outfall 002. At the culmination of the 18-month paragraph 11(c) Initial Characterization period, a final report summarized the findings of the paragraph 11(c) sampling events and provided recommendations for transitioning to paragraph 11(d) Ongoing Sampling (Geosyntec 2020a). An addendum to the final report was submitted on May 28, 2021 to report bimonthly samples collected in October 2020 and November 2020 (Geosyntec, 2021a). The first semiannual report addressing paragraph 11(d) was submitted on September 28, 2021 (Geosyntec 2021b). Sampling conducted under the Ongoing Sampling program included in the first semiannual report (Geosyntec, 2021b) and this report was consistent with sampling conducted in the Initial Characterization Period, since at the time of sample collection, Chemours had not received comments from DEQ regarding Geosyntec recommended changes to the sampling program discussed in the final paragraph 11(c) report (Geosyntec 2020a). On March 8, 2022, Chemours responded to comments from a January 5, 2022 DEQ letter related to the recommended changes to the sampling program. In the response, a technical meeting was proposed to discuss those comments and responses.

This semiannual report summarizes the findings for the three (3) paragraph 11(d) sampling events during 2021 Quarters 3 and 4 and provides further support for implementing the recommendations proposed at the conclusion of the paragraph 11(c) Initial Characterization period. The remainder of this document is organized as follows:

Section 2 – Background: this section describes the Facility, the conveyance network which transmits flow to Outfall 002, locations sampled and location categories, and recommendations from the paragraph 11(c) Initial Characterization period and the paragraph 11(d) first semiannual period of Ongoing Sampling.

Section 3 – Semiannual Report Objectives: this section describes the objectives of this report.

Section 4 – Paragraph 11(d) Methods and Scope: this section describes the methods employed for sample collection and analysis for 2021 Quarters 3 and 4.

Section 5 – Assessment of Paragraph 11(d) Ongoing Sampling: this section describes PFAS concentrations trends and observations in investigative samples over the second semiannual period in context with paragraph 11(c) observations.

Section 6 – Summary and Recommendations: this section summarizes the observations of results from the second semiannual period and recommended changes to the sampling plan for ongoing sampling activities pursuant to paragraph 11(d) of the executed Consent Order.

Section 7 – References: this section lists the documents referenced in the report.

2. BACKGROUND

This section provides a summary of previous paragraph 11(c) and 11(d) reports, an overview of Facility water uses, the types of water present at the site, how this water flows to the Facility's discharge point at Outfall 002, how the locations sampled as part of paragraph 11(c) and paragraph 11(d) are grouped for interpretation, and the recommendations from previous paragraph 11(c) and paragraph 11(d) sampling events.

2.1 Paragraph 11(c) and 11(d) Reporting Background

Chemours submitted the PFAS Characterization Sampling Plan (the Sampling Plan) to DEQ on May 6, 2019 (Geosyntec, 2019a) and received written approval to implement the program from DEQ on June 19, 2019. Quarterly reports for the Initial Characterization Period summarized the activities conducted during the previous quarter, reported observed trends in context to previous bimonthly sampling events, and provided recommendations to implement during the next quarter. The first semiannual report for the Ongoing Sampling Period also followed this structure. A summary of the bimonthly sampling events and supplemental investigations included in past Paragraph 11(c) and 11(d) reports are provided in the table below.

Report ID	Date Submitted	Activities Summarized	Reference
P11(c) Quarterly Report 1	July 31, 2019	April 2019 and June 2019 bimonthly sampling events collected in 2019 Quarter 2	Geosyntec, 2019b
P11(c) Quarterly Report 2	October 31, 2019	August 2019 bimonthly sampling event collected in 2019 Quarter 3 and supplemental investigations completed in 2019 Quarters 2 and 3	Geosyntec, 2019c

Report ID	Date Submitted	Activities Summarized	Reference
P11(c) Quarterly Report 3	January 31, 2020	October 2019 and December 2019 bimonthly sampling events collected in 2019 Quarter 4	Geosyntec, 2020b
P11(c) Quarterly Report 4	April 30, 2020	January 2020 bimonthly sampling event collected in 2020 Quarter 1	Geosyntec, 2020c
P11(c) Quarterly Report 5	July 31, 2020	April 2020 and May/June 2020 bimonthly sampling events collected in 2020 Quarter 2	Geosyntec, 2020d
P11(c) Quarterly Report 6 (Final)	December 18, 2020	Overall conclusions and recommendations from the paragraph 11(c) Initial Characterization period; August 2020 bimonthly sampling event collected in 2020 Quarter 3	Geosyntec, 2020a
P11(c) Addendum 1	May 28, 2021	October 2020 and November 2020 bimonthly sampling events collected in 2020 Quarter 4 – these bimonthly events were collected after Initial Characterization period and prior to the beginning of Ongoing Sampling	Geosyntec, 2021a
P11(d) Semiannual Report 1	September 28, 2021	February 2021, April/May 2021, and June 2021 bimonthly sapling events collected in 2021 Half 1	Geosyntec, 2021b

2.2 Site and Conveyance Network Background

Chemours and the two Fayetteville Works site tenants, Kuraray and DuPont, currently operate five manufacturing areas on the site along with two other areas servicing manufacturing activities. These areas are shown in Figure 1 and listed below:

- Chemours Monomers/Ion Exchange Materials (Monomers/IXM)
- Chemours Polymer Processing Aid (PPA) Area
- Kuraray Trosifol® Leased Area
- Kuraray SentryGlas® Leased Area
- DuPont Polyvinylfluoride Leased Area
- Wastewater treatment plant (WWTP)
- Power Area at the Facility (produces filtered water and demineralized water)

These various areas both use and produce water which flows through the site conveyance network to Outfall 002. The site conveyance network waters are comprised of three (3) water types and five (5) primary flow pathways as they combine at Outfall 002. The water types and flow pathways at the Facility are listed below:

Water Types

1. Process wastewater (Note: Chemours process wastewaters are presently either treated and reused on site or disposed of offsite while tenant [Kuraray and DuPont] process wastewaters are treated at the onsite WWTP prior to discharge).
2. Non-Process Wastewater (Note: Non-Process Wastewater is also commonly called non-contact cooling water [NCCW] and steam condensate).
3. Stormwater.

Flow Pathways

1. Monomers/IXM Conveyance Network, which transmits NCCW and stormwater from the Chemours Monomers/IXM area.
2. Wood Lined Trench, which transmits NCCW from Kuraray areas and stormwater from Kuraray and limited areas in the Chemours PPA area.
3. Wastewater Treatment Plant Discharge, which transmits treated waters from the WWTP.
4. DuPont Area Ditches, which transmit NCCW and stormwater from DuPont.
5. Open Channel to Outfall 002, which combines the above flows and transmits and discharges them through Outfall 002.

2.2.1 Locations and Location Categories

Sample locations have been grouped into seven location categories developed to facilitate analysis and interpretation of data collected during this program. The location categories were developed

based on locations having either (a) a common type of water (e.g., NCCW), or (b) a common spatial and flow path relationship (e.g., WWTP related locations). The seven categories are listed and briefly described below:

Location Category	Description
River Water Intake at Facility	Represents background PFAS concentrations
Non-Chemours Process Wastewater	Locations representing process wastewater from Kuraray and DuPont
Non-Contact Cooling Water	Locations representing NCCW from Kuraray and Chemours
Stormwater	Locations containing only stormwater from throughout the Facility
Stormwater / Non-Contact Cooling Water	Locations representing commingled stormwater and NCCW
Wastewater Treatment Plant	Locations representing the WWTP influent and effluent and the Terracotta pipe, which prior to November 2017 transmitted Chemours process wastewater to the WWTP and was fully decommissioned in April 2021
Combined Flows to Outfall 002	Locations representing stormwater, NCCW, and process wastewater from the combined flow pathways at the Facility in the Open Channel to Outfall 002

2.3 Background - Recommendations from Paragraph 11(c) and Paragraph 11(d) through June 2021

The recommendations from the Initial Characterization period (April 2019 to December 2020) and from the first semiannual Ongoing Sampling period (January 2021 to June 2021) are summarized below and discussed in greater detail in the reports listed in Section 2.1:

- Continue analyzing EPA 537M at the intake river water (Location 1) and Outfall 002 (Location 20) only

- Upon completion of the Monomers/IXM Stormwater treatment system (SWTS) by June 30, 2021¹, replace Locations 9, 10, 10A, 24A, 24B, and 24C with one new sample location representing the combined NCCW (Location 9A)
- Replace current locations representing inputs to the WWTP (Locations 6A, 6B, 18, 19A, 19B, 23A, 23B) with ongoing sampling of the WWTP influent (Location 22)
- Replace stormwater-only Locations 2, 3, 4, and 5 with ongoing sampling of downstream Location 7A

Chemours submitted these recommendations to DEQ in both the paragraph 11(c) Final Quarterly Report (Geosyntec, 2020a) and the paragraph 11(d) first Semiannual Report (Geosyntec, 2021b). Since DEQ has not yet approved of these recommendations, recent sampling conducted under the Ongoing Sampling program was consistent with sampling conducted during the Initial Characterization period and the first semiannual Ongoing Sampling period. On January 5, 2022, DEQ provided comments on the Paragraph 11(d) sampling program. Chemours responded to those comments and requested a meeting to clarify the ongoing sampling activities in a letter to DEQ dated March 8, 2022.

3. SEMIANNUAL REPORT OBJECTIVES

This second semiannual report summarizes the data from three bimonthly Ongoing Sampling events in 2021 Quarters 3 and 4 that have been conducted to characterize PFAS in non-process wastewater, process wastewater, and stormwater at the Facility. Objectives of the second semiannual report are to:

- 1) Evaluate trends and observations at each location / location category in context with conclusions drawn from the Initial Characterization Period and the first semiannual Ongoing Sampling period.
- 2) Review the recommendations made for the Ongoing Sampling program based on findings from the Initial Characterization period and the first semiannual period of Ongoing Sampling and confirm the results from the second semiannual period of Ongoing Sampling continue to support those recommendations.

4. PARAGRAPH 11(D) METHODS AND SCOPE

This section describes the methods implemented for the second semiannual Ongoing Sampling period including locations sampled, field methods implemented, and laboratory methods used.

¹ The Monomers/IXM stormwater treatment system was operational as of June 30, 2021 and is currently being monitored in accordance with the Stormwater Treatment System Sampling Plan (Geosyntec, 2021c).

Samples were collected during wet weather on August 17 and 23, 2021 (the August 2021 event); during wet weather on September 22, 23, and 24, 2021 (the September 2021 event); and during wet weather on December 8, 9, and 10, 2021 (the December 2021 event). This sampling was conducted as outlined in the Sampling Plan (Geosyntec, 2019a), with adjustments made based on recommendations in prior reports (Geosyntec 2019a, 2019b, 2019c, 2020b, 2020c, and 2020d). Recommendations made in the Final Quarterly Report (Geosyntec, 2020a) and the first Ongoing Sampling Semiannual Report (Geosyntec 2021b) are awaiting approval from DEQ; however, some changes were required due to recent site work (Geosyntec, 2021b). These changes are summarized in Section 4.1.

4.1 Sample Locations

Locations sampled are described in Table 1 and shown in Figures 2 and 3. Figures 2 and 3 display the sample locations prior to and after SWTS and Terracotta pipe activities described in the paragraph 11(d) first Semiannual Report (Geosyntec, 2021b).

The number of samples collected during the second semiannual period were twenty-six (26) in the wet August 2021 event, twenty-seven (27) in the wet September 2021 event, and twenty-seven (27) in the wet December 2021 event sampling. Table 1 provides a summary of the sample locations collected during each event. Samples could not be collected from some locations because they were dry during the sampling event or because recent site work prohibited sample collection or eliminated the sample locations. Additionally, some sample locations were added to characterize locations that were no longer accessible due to recent site work. A summary of the reasoning for samples that were excluded from or added to the sampling events in the 2021 second semiannual period is provided below:

- Location 6A was not sampled during the August, September, and December 2021 events because Kuraray ceased operations at this location due to re-routing of the Kuraray process wastewater lines after decommissioning of the Terracotta pipe. Water from this location is currently captured with Location 23C-3.
- Location 10 was not sampled during the August, September, and December 2021 events as there was no active flow due to the presence of the SWTS sump in front of this location.
- Location 11 was not sampled during the August 2021 event because the location was dry.
- Locations 23A (Terracotta pipe) and 23B (Kuraray laboratory process wastewater) were not sampled during the August, September, and December 2021 events because the

Terracotta pipe was decommissioned on April 21, 2021. The new sample location representing Location 23B is Location 23C-2.

- Locations 23C-1, 23C-2, and 23C-3 were added to the sampling program as they came into services after the decommissioning of the Terracotta pipe.
- Locations 24A, 24B, and 24C were removed from the sampling program after the June 2021 sampling event because they are no longer accessible due to separation of stormwater and NCCW in the Monomers/IXM area.

4.2 Field Methods

Field methods used during the second Ongoing Sampling semiannual period were consistent with methods documented in the previous semiannual report. The following sub-sections summarize these field methods.

4.2.1 General Field Methods

Equipment was inspected by the field program supervisor, decontaminated, and calibrated daily prior to use in the field, according to the manufacturer's recommendations. Field parameters (e.g., pH, temperature, turbidity) were measured with a water quality meter prior to sample collection for grab samples, and during composite sampling for temporal composite samples (collected directly from the water stream). A field notebook and location-specific field forms were used to record information regarding additional items such as quality assurance/ quality control (QA/QC), sample identifications, color, odor, and other field observations.

Field QA/QC samples, including blind field duplicates, equipment blanks, field blanks, and trip blanks were collected in general accordance with the Sampling Plan (Geosyntec, 2019a).

Upon sample collection, labelled and containerized samples were placed inside an insulated sample cooler with ice. Prior to shipment of the samples to the laboratory, a chain of custody form was completed identifying sample locations, sample identification numbers, and specific laboratory analyses to be performed on the samples. Chain of custody forms were signed by the field personnel relinquishing the samples to the courier and were signed by the laboratory upon receipt of the cooler.

4.2.2 Grab Sampling Methods

Grab samples were collected from locations where temporal variability over the course of one day was not expected. These locations include non-process wastewater only locations (Locations 6B and 9A); select process wastewater only locations (Locations 19A and 19B); and the Sediment Basin North and South locations (Locations 21A and 21B), as identified in Table 1 and shown on Figure 3.

4.2.3 Temporal Composite Sampling Methods

Temporal composite samples were collected during the bimonthly sampling events from locations where variability was expected to potentially be significant within a short time frame (e.g., one day). These locations, identified in Table 1 and shown on Figure 3, include those within the site conveyance network and the intake and outfall locations, since these locations can have highly variable dissolved and suspended constituent loads over short time periods. Temporal composite samples were collected using a dedicated Teledyne 6712C autosampler equipped with a rain gauge, high-density polyethelene (HDPE) tubing, silicon tubing, and an HDPE sample reservoir. During dry sampling events, autosamplers integrated water over a four-hour sample collection period. During wet sampling events, the integration time on the autosamplers was set to correspond to the duration of the storm event.

4.2.4 Wet Event Sampling Methods

The August 2021 event included a wet sampling event on August 17, 2021 and a dry sampling event on August 23, 2021. Locations that contain stormwater (Locations 1, 2, 3, 4, 5, 7A, 7B, 7C, 9, 10A, 12, 13, 14, 15, and 20) were sampled on August 17, 2021 during a storm event. The storm event began on August 15, 2021 at 3:30 PM and lasted through August 19, 2021 at 12:45 PM; a total of 0.75 inches of rain fell during the storm event. Composite samples were collected for up to eight hours. In accordance with the PFAS Characterization Sampling Plan (Geosyntec, 2019a), Locations 6B, 8, 9A, 18, 19A, 19B, 21B, 22, 23C-1, 23C-2, and 23C-3 were collected during dry weather after rainfall ended on August 19, 2021.

The September 2021 event included a wet sampling event on September 22, 2021 and a dry sampling event on September 23 and 24, 2021. Locations that contain stormwater (Locations 1, 2, 3, 4, 5, 7A, 7B, 7C, 9, 10A, 11, 12, 13, 14, 15, and 20) were sampled on September 22, 2021 during a storm event. The storm event began on September 21, 2021 at 8:00 AM and lasted through September 22, 2021 at 12:30 PM; a total of 1.92 inches of rain fell during the storm event. Composite samples were collected for up to eight hours. In accordance with the PFAS Characterization Sampling Plan (Geosyntec, 2019a), Locations 6B, 8, 9A, 18, 19A, 19B, 21B, 22, 23C-1, 23C-2, and 23C-3 were collected during dry weather after rainfall ended on September 22, 2021.

The December 2021 event included a wet sampling event on December 8, 2021 and a dry sampling event on December 9 and 10, 2021. Locations that contain stormwater (Locations 1, 2, 3, 4, 5, 7A, 7B, 7C, 9, 10A, 11, 12, 13, 14, 15, and 20) were sampled on December 8, 2021 during a storm event. The storm event began on December 8, 2021 at 5:00 AM and lasted through December 8, 2021 at 1:00 PM; a total of 1.08 inches of rain fell during the storm event. Composite samples were collected for up to eight hours. In accordance with the PFAS Characterization Sampling Plan (Geosyntec, 2019a), Locations 6B, 8, 9A, 18, 19A, 19B, 21B, 22, 23C-1, 23C-2, and 23C-3 were collected during dry weather after rainfall ended on December 8, 2021.

4.3 Laboratory Methods

Samples were analyzed for PFAS by the following methods:

- Table 3+ Laboratory Standard Operating Procedure (SOP); and
- EPA Method 537 Mod Laboratory SOP (EPA 537M).

PFAS reported under each of these methods are listed in Table 2.

The August, September, and December 2021 events were analyzed using the low-level Table 3+ SOP method, with minimum reporting limits range from 2 to 20 nanograms per liter (ng/L). This is consistent with previous sampling conducted under paragraph 11. In accordance with the Paragraph 18 Response (Geosyntec, 2021d), perfluorocarboxylic acids (PFCAs) reported under Method 537 may be a byproduct of Site manufacturing activities and therefore analysis of the 13 PFCAs was included in the August, September, and December 2021 events. Other Method 537 PFAS, which are not site-related and are not frequently observed onsite above background Cape Fear River levels, were not included.

Laboratory analyses were performed largely in accordance with the Sampling Plan (Geosyntec, 2019a) and within the guidelines specified by the laboratory SOPs. The collection frequency of field duplicates, matrix spike / matrix spike duplicates, trip blanks, and equipment blanks was largely in accordance with the Sampling Plan (Geosyntec, 2019a).

All data were reviewed using the Data Verification Module (DVM) within the Locus Environmental Information Management (EIM) system, which is a commercial software program used to manage data. Following the DVM process, a manual review of the data was conducted. The data usability, in view of the project's data quality objectives, was assessed and the data were entered into the EIM system. Additional details regarding the data review process are provided in Section 5.2.1.

5. ASSESSMENT OF PARAGRAPH 11(D) ONGOING SAMPLING

This section presents an assessment of the key observations during the second six (6) months of Ongoing Sampling within the context of observations from the first six (6) months of Ongoing Sampling and the Initial Characterization period. Observations in this section are based on total Table 3+ concentrations and EPA 537M (13 PFCA) concentrations.

5.1 Presentation of Results Table 3+ 17 Compounds

For clarity, the text and figures of this report describe the Table 3+ 17 compound sums while both Table 3+ 17 compound and Table 3+ 20 compound sums are included in the tables.

As reported in the *Matrix Interference During Analysis of Table 3+ Compounds* memorandum (Geosyntec, 2020e), matrix interference studies conducted by the analytical laboratory

(TestAmerica, Sacramento) have shown that the quantitation of three compounds (2,2,3,3,4,5,5,5-octafluoro-4-(1,1,2,2-tetrafluoro-2-sulfoethoxy)-pentanoic acid [R-PSDA], 2-fluoro-2-[1,1,2,3,3,3-hexafluoro-2-(1,1,2,2-tetrafluoro sulfoethoxy)propoxy]-acetic acid [Hydrolyzed PSDA], and 4-(2-carboxy-1,1,2,2-tetrafluoroethoxy)-2,2,3,3,4,5,5,5-octafluoropentanoic acid [R-EVE]) is inaccurate due to interferences by the sample matrix in both groundwater and surface water. Given the matrix interference issues, Total Table 3+ PFAS concentrations are calculated and presented two ways in this report: (i) summing over 17 of the 20 Table 3+ compounds “Total Table 3+ (17 compounds)”, i.e., excluding results of R-PSDA, Hydrolyzed PSDA, and R-EVE, and (ii) summing over 20 of the Table 3+ compounds “Total Table 3+ (20 compounds)”. For clarity, the text, tables, and figures of this report describe the Total Table 3+ (17 compounds), though the report tables also include results for Total Table 3+ (20 compounds).

5.2 Results - Semiannual Period (2021 Quarters 3 and 4)

This section describes the data quality, field parameter data, and investigative sample results from the August, September, and December 2021 events. PFAS concentrations for all sample locations in the August, September, and December 2021 events are provided in Appendix A. Table 3 provides the total daily precipitation within the vicinity of the Facility and the flow measured at Outfall 002 at the times of sampling events discussed in this report. Field parameters recorded during the August, September, and December 2021 events are provided in Appendix B.

The observations and assessment described in this section are based on the following figures:

Figures 4A – 4F present time series plots for total Table 3+ concentrations. Each time series plot displays the total Table 3+ concentrations observed during each event of the Ongoing Sampling period at the river water intake (Location 1) and at other locations as grouped by sample location type described in Section 2.2 (e.g., Stormwater, NCCW, etc.).

Figures 5A and 5B display the distribution of total Table 3+ and EPA 537M (13 PFCA) concentrations by location for all sampling locations, respectively. Samples collected prior to January 2021 are displayed in gray to provide comparison between the Ongoing Sampling period and the Initial Characterization period.

The analytical reporting limits associated with the August, September, and December 2021 event data were determined by the laboratories. Appendix A lists the minimum reporting limits for non-detected analytes. As discussed in the first semiannual Ongoing Sampling report, the Table 3+ reporting limits for April/May 2021 were higher than previously analyzed samples. Figures 4A – 4F symbolize the April/May event in orange hatching to differentiate the higher reporting limits. The higher reporting limits were considered acceptable for the April/May 2021 event because all other events, including the prior nine events during the Initial Characterization Period and all other Ongoing Sampling events, were analyzed with lower reporting limits.

TestAmerica analytical reports and the data review narrative whitebooks are provided in Appendix C.

5.2.1 Data Quality

Data Management and Reporting

Chemours's Analytical Data Quality Management team currently uses the EIM system for management of analytical data, xyz Site coordinate data, and field parameter data. Validation and qualification of data are performed by AECOM who maintains the EIM system for the Chemours Fayetteville Site. Whitebooks consisting of the data review narratives and the laboratory analytical reports produced by AECOM summarize the findings of the DVM and manual review process.

QA/QC Samples

PFAS concentrations for all field QA/QC samples in the August, September, and December 2021 events are reported in Appendix A. The following observations were noted for the QA/QC samples:

- The relative percent difference (RPD) for field duplicate pairs in the August, September, and December 2021 events were generally less than 30% for all PFAS. Where RPDs were greater than 30%, the reported results may be imprecise and were J qualified, indicating the results are estimated.
- No PFAS were detected above the associated reporting limits in the August, September, and December 2021 Equipment Blanks, Trip Blanks, or Field Blanks.

5.2.2 Field Parameter Data

Field parameters recorded during the August, September, and December 2021 events are provided in Appendix B for grab samples and temporal composite samples. Field notes are provided in Appendix D. Field parameters were measured using a Horiba U-52 model. The water quality meter was calibrated at the start of every sampling day.

For grab samples, field parameters were measured once prior to sampling using a flow through cell. For temporal composite samples, field parameters were measured once during composite sampling and collected directly from the water stream.

Recorded field parameter data observed during the August, September, and December 2021 events are generally in accordance with expectations for the sample locations, with the following exceptions.

- Most locations had recorded oxidation reduction potential (ORP) between -27 and 443 millivolts (mV). The WWTP combined influent (Location 22) had the lowest ORP reading at -88 mV during the December 2021 event. The combined Chemours Monomers/IXM

NCCW and stormwater discharge (Location 10A) had the highest ORP reading at 467 mV during the August 2021 event, suggesting greater contact with atmospheric oxygen.

- Most locations had recorded turbidity between 0 and 300 nephelometric turbidity units (NTU). The Kuraray southern leased area NCCW discharge – Resins Area (Location 6B) and the Sediment Basin North (Location 21B) had turbidity measurements greater than 300 NTU during the September 2021 event at 652 and 1,172 NTU, respectively.
- Most locations had recorded temperature between 10 and 30 degrees Celsius (°C). The Kuraray southern leased area NCCW discharge – Resins Area (Location 6B) had temperature measurements between 48 and 55°C during all three sampling events, reflecting the temperature of the piping that was sampled.

5.3 Conveyance Network PFAS Data Observations

Observations from the second six months of the Ongoing Sampling period are generally consistent with previous sampling events and further support the conclusions and recommendations from the Paragraph 11(c) Final Quarterly Report (Geosyntec, 2020a) and the first six months of the Ongoing Sampling period (Geosyntec, 2021b). A summary of observations from the second six months of Ongoing Sampling is provided below.

General Observations

Samples collected from the river water intake at the facility (Location 1) continues to contain PFAS before this water is used at the Facility. PFAS detected at Location 1 represent the background level of PFAS at other sampling locations.

Consistent with previous samples collected during the Initial Characterization period, PFCA concentrations reported under the EPA 537M method across all locations were generally similar to Location 1 (Figure 5B). In some cases, some stormwater-NCCW locations had higher PFCA concentrations than Location 1, however the total PFCA concentrations for those locations mostly fell between 10 and 100 ng/L, similar to Location 1. This continues to support: (1) the Initial Characterization period conclusion that the site is not a significant contributor of EPA 537M PFAS to Outfall 002, and (2) the Initial Characterization period recommendation of analyzing EPA 537M PFAS at Location 1 and Location 20 (Outfall 002) only.

The distribution of Table 3+ PFAS for sample locations during the Ongoing Sampling Period was generally within the range observed for samples collected in 2019 and 2020 (Figure 5A), where water from locations that contain stormwater tend to have higher Table 3+ concentrations than Location 1, and water from non-Chemours Process wastewater locations and NCCW locations tend to have similar Table 3+ concentrations to Location 1. Recent site work was conducted to reduce PFAS contributions to Outfall 002, including decommissioning of the Terracotta pipe (completed April 2021) and collection and conveyance of stormwater from the Monomers/IXM area to the SWTS (completed June 2021). The effects of this site work are discussed further below.

Locations Containing Only Non-Chemours Process Wastewater or NCCW

Samples collected from non-Chemours process wastewater locations (Locations 18, 19A, 19B, 23C-2, and 23C-3) and NCCW only locations (Locations 6B and 9A) continue to have low Table 3+ and EPA 537M PFAS concentrations, similar to or less than those observed at the river water intake at the Facility (Figure 4A, Figure 4B, Figure 5A, Figure 5B). This supports replacing these locations with ongoing sampling of the combined influent to the WWTP (Location 22), as recommended in the Final Quarterly Report (Geosyntec, 2020a). An exception to these observations and recommendations is noted for Location 23C-1 in December 2021, where the total Table 3+ concentration is significantly higher than at Location 1, driven by an elevated PMPA concentration at Location 23C-1 (Figure 4A). Elevated PMPA concentrations are not observed at Location 23C-1 during the August or September 2021 events, and contamination is suspected for the December 2021 event that may be related to a red-colored greasy film observed on top of the sample collected in December 2021 that was not observed in other events. Sampling at this location should continue for at least two more bimonthly sampling events to monitor PMPA concentrations.

Locations Containing Stormwater

Samples collected from stormwater-only locations continue to show elevated Table 3+ PFAS concentrations compared to the river water intake at the Facility (Location 1), with the highest concentrations represented at Location 3 and Location 11 (Figure 4C), which are not affected by stormwater capture by the SWTS. As of June 30, 2021, stormwater from the Monomers/IXM area is now being collected and treated per CO Addendum paragraph 4(a).

Table 3+ PFAS concentrations in samples collected from Location 15 (a stormwater-NCCW location) were significantly higher in the September 2021 event than in the August or December 2021 events (Figure 4D). During sample collection for the September 2021 event, a portion of the stormwater bypassed the SWTS as the rainfall exceeded 1.0 inches during this collection event (Geosyntec, 2021e). This bypass likely contributed to the elevated concentrations observed at Location 15, which includes NCCW water from the Monomers/IXM area. No bypass was observed during sample collection for the August or December 2021 events.

Locations comprising both stormwater and non-process wastewater from the Monomers/IXM area (Locations 9, 10A, and 15) all had lower Table 3+ PFAS concentrations than the February 2021 wet event (Figures 4D). This is also reflected at locations along the Open Channel to Outfall 002 (Locations 7C and 20; Figure 4F). These data suggest that the SWTS, which was commissioned on June 30, 2021, is reducing PFAS concentrations for these locations that include stormwater from the Monomers/IXM area. Future wet events will continue to monitor the effects of the SWTS.

Locations at the Wastewater Treatment Plant

Location 22 (the WWTP influent) and Location 8 (the WWTP effluent) often had elevated Table 3+ PFAS compared to Location 1, with the exception of Location 22 in the August and December 2021 events (Figure 4E), which were similar to Location 1. The WWTP has received flows

containing elevated Table 3+ PFAS from a combination of sources described in the *WWTP Table 3+ PFAS Loading Assessment* (Geosyntec, 2021f), including the now decommissioned terracotta pipe, effluent from washing machines, and some stormwater flows. Chemours rerouted washing machine effluent for offsite disposal from the PPA Area on September 29, 2021, which will further reduce loadings to the WWTP. In addition, the abandonment and replacement of the Terracotta Pipe in April 2021 will have reduced loadings to the WWTP. PFAS concentrations at upstream locations representing the piping that replaced the Terracotta pipe (Locations 23C-2, 23C-3, and 18) are similar to or less than those observed at the river water intake (Figure 4A).

Locations Removed from Sampling Program

Decommissioning of the Terracotta pipe occurred in April 2021 and so is no longer a source of PFAS to Outfall 002. The two sampling locations (Locations 23A and 23B) on the Terracotta pipe were no longer accessible after the February 2021 event and were removed from the sampling program (Figure 4A and Figure 4E).

Samples collected from Location 6A (an NCCW location) previously contained PFAS due to potential backflushing from the Terracotta pipe. Kuraray ceased operations at this location due to the rerouting of the Kuraray process wastewater lines associated with decommissioning of the Terracotta pipe and it has been removed from the sampling program (Figure 4B). Water from this location is currently captured with Location 23C-3.

Locations 24A, 24B, and 24C have been removed from the sampling program because they no longer exist due to the separation of stormwater and NCCW in the Monomers/IXM area. These locations are now represented at a single point (Location 9A) representing combined NCCW from the Monomers/IXM area in future sampling events (Figure 3).

Based on these observations, the conclusions and recommendations drawn from the Initial Characterization period are supported, as discussed below. Subsequent bimonthly sampling during the remaining 12 months of the Ongoing Sampling period will provide more information on the effect of the commissioning of the SWTS and the decommissioning of the Terracotta pipe on PFAS concentrations at Outfall 002.

6. SUMMARY AND RECOMMENDATIONS

Pursuant to Consent Order paragraph 11(d), this second semiannual report summarizes results and observations from the three (3) bimonthly sampling events collected during the Ongoing Sampling period 2021 Quarters 3 and 4.

Observations and trends from the Ongoing Sampling program continue to support the findings from the Initial Characterization period, which include:

- The river water intake is a background source of PFAS.
- The site is not a significant contributor of EPA 537M PFAS to Outfall 002.
- Non-Chemours process wastewater and NCCW are not significant contributors of Table 3+ PFAS to Outfall 002.
- The primary sources of Table 3+ PFAS to Outfall 002 are water from stormwater-only sampling locations and locations comprising both stormwater and NCCW from the Monomers/IXM area. The SWTS was commissioned on June 30, 2021 and recent data suggests that the SWTS is resulting in reduced PFAS concentrations at downstream sampling locations including Outfall 002.

Observations from the Ongoing Sampling program also continue to support the recommendations to the sampling program that were made based on findings from the Initial Characterization period. These recommendations are summarized based on current site conditions as follows:

- Continue analyzing EPA 537M PFCAs at the intake river water at Location 1 and Location 20 only.
- Replace Locations 9, 10, 10A with one new sample location representing the combined NCCW at Location 9A.
- Replace the current locations representing inputs to the WWTP (Locations 6A, 6B, 18, 19A, 19B, 23C-2, and 23C-3) with ongoing sampling of the WWTP influent (Location 22). Also replace Location 23C-1 with ongoing sampling of Location 22 if PFAS concentrations at Location 23C-1 for two further sampling events remain low and similar to Location 1.
- Replace stormwater-only Locations 2, 3, 4, and 5 with ongoing sampling of downstream Location 7A.

Based on recent site work, the following locations no longer exist and have been removed from the sampling program:

- Location 6A no longer exists due to re-routing of the Kuraray process wastewater lines to the WWTP.
- Locations 23A and 23B no longer exist due to the decommissioning of the Terracotta pipe.
- Locations 24A, 24B, and 24C no longer exist due to the separation of stormwater and NCCW for treatment of stormwater from the Monomers/IXM area.
- Locations 23C-1, 23C-2, and 23C-3 were added to the sampling program after the decommissioning of the Terracotta pipe.

Pursuant to paragraph 11(d), Chemours will continue to collect bimonthly samples to characterize PFAS in the intake river water, process wastewater, non-process wastewater, and stormwater at

the Facility through December 2022, completing two full years of such sampling. The proposed sampling locations for the remainder of paragraph 11(d) are identified in Figure 6. On March 8, 2022, Chemours responded to comments from a January 5, 2022 DEQ letter related to those proposed sampling locations among other things. In the response, a technical meeting was proposed to discuss those comments and responses. Results will continue to be reported semiannually, within 90 days of the previous semiannual period. The next semiannual report will be submitted within 90 days of the end of Quarter 2, 2022.

Notes:

Sample Events

- February 2021 event (Q1) - 18 and 19 February 2021
- April/May 2021 event (Q2) - 26 and 29 April 2021 and 4 and 7 May 2021
- June 2021 event (Q2) - 18 June 2021
- August 2021 event (Q3) - 17 and 23 August 2021
- September 2021 event (Q3) - 22, 23, and 24 September 2021
- December 2021 event (Q4) - 8, 9, and 10 December 2021

Sample numbers refer to locations identified in Figures 2 and 3.

All temporal composite samples collected in dry weather were integrated over 4 hours. Temporal composite samples collected during storm events were integrated over up to 8 hours to line up with the storm event.

1 - Currently active locations are sampling locations that are actively being sampled for P11(d) Ongoing Sampling.

2 - Samples collected in April 2021 and May 2021 are considered one sampling event, the April/May 2021 event. Sample locations were collected over multiple days due to construction related to the decommissioning of the Terracotta pipe and separation of stormwater and NCCW in the Monomers IXM area.

3 - Location 23B was not sampled after the February 2021 event because the sample location was no longer in service after the decommissioning of the Terracotta pipe. The new sample location representing this water source is Location 23C-2.

4 - Location 23C-1 was collected as a temporal composite sample during the August and December 2021 events and as a grab sample during the September 2021 event.

5 - Locations 23C-1, 23C-2, and 23C-3 were added to the sampling program as they came into service after the decommissioning of the Terracotta pipe.

6 - Location 23C-1 was not sampled in the June 2021 event because the location was offline on the day of sampling.

7 - Location 23C-2 was collected as a grab sample during the April/May 2021 event and as a temporal composite during subsequent events.

8 - Location 6A was not sampled during the August, September, and December 2021 events because the location is no longer in service due to re-routing of the Kuraray process wastewater lines due to decommissioning of the Terracotta pipe.

9 - Location 6B was not sampled during the June 2021 event because there was no water coming from the sample pipe.

10 - Location 9A was added to the sampling program after completion of the Monomers/ IXM Stormwater Treatment System

11 - Locations 24A, 24B, and 24C have been removed from the sampling program after the June 2020 sampling event because they are no longer accessible due to separation of stormwater and NCCW in the Monomers/IXM area.

12 - Locations 9 and 10A were not sampled during the June 2021 event due to construction related to the separation of stormwater and NCCW in the Monomers IXM area.

13 - Location 21A was sampled through August 2021 because Location 21B was not in use. Location 21B was sampled in September and December 2021 because Location 21A was not in use.

14 - Location 23A was not sampled after the February 2021 event because the Terracotta pipe was decommissioned on April 21, 2021.

IXM - ion exchange membrane

NCCW - non-contact cooling water

NS - Not sampled

PFAS - per- and polyfluoroalkyl substances

PPA - polymer processing aid

WWTP - Wastewater treatment plant

Notes:

1. Precipitation data obtained from USGS rain gauge at W.O. Huske Dam.

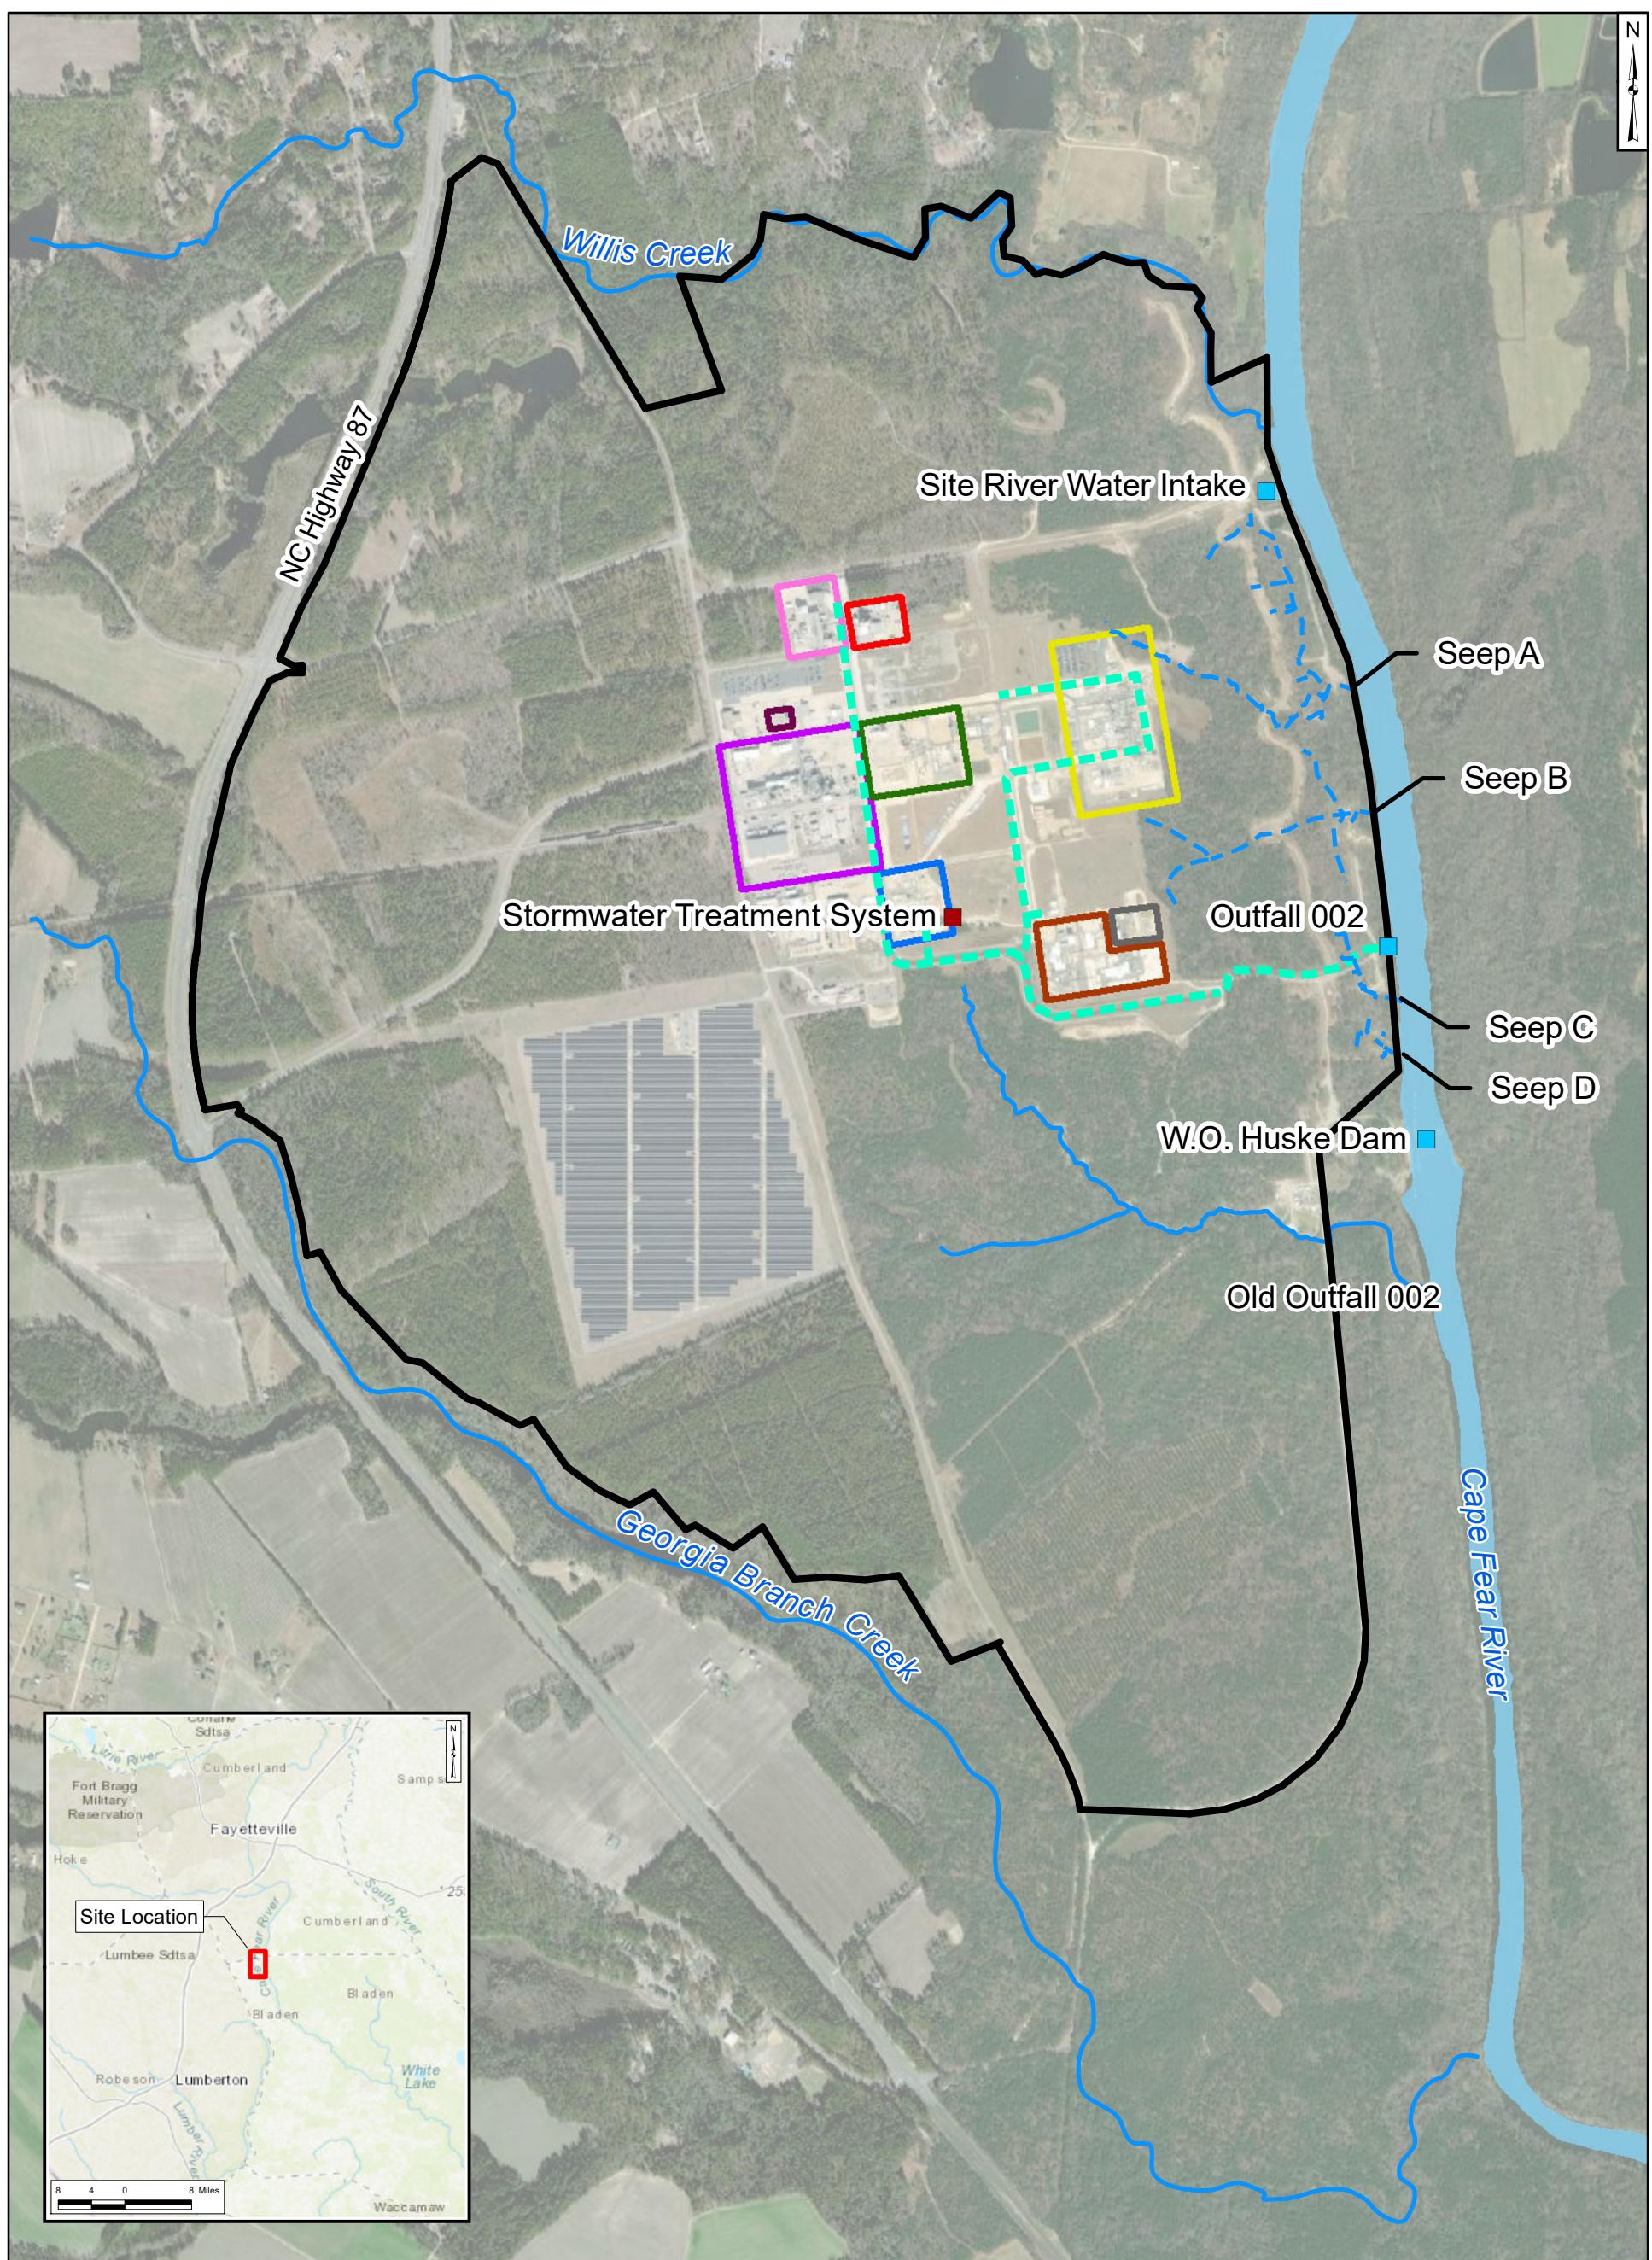

MGD - million gallons per day

USGS - United States Geological Survey

-- - below USGS measurement threshold

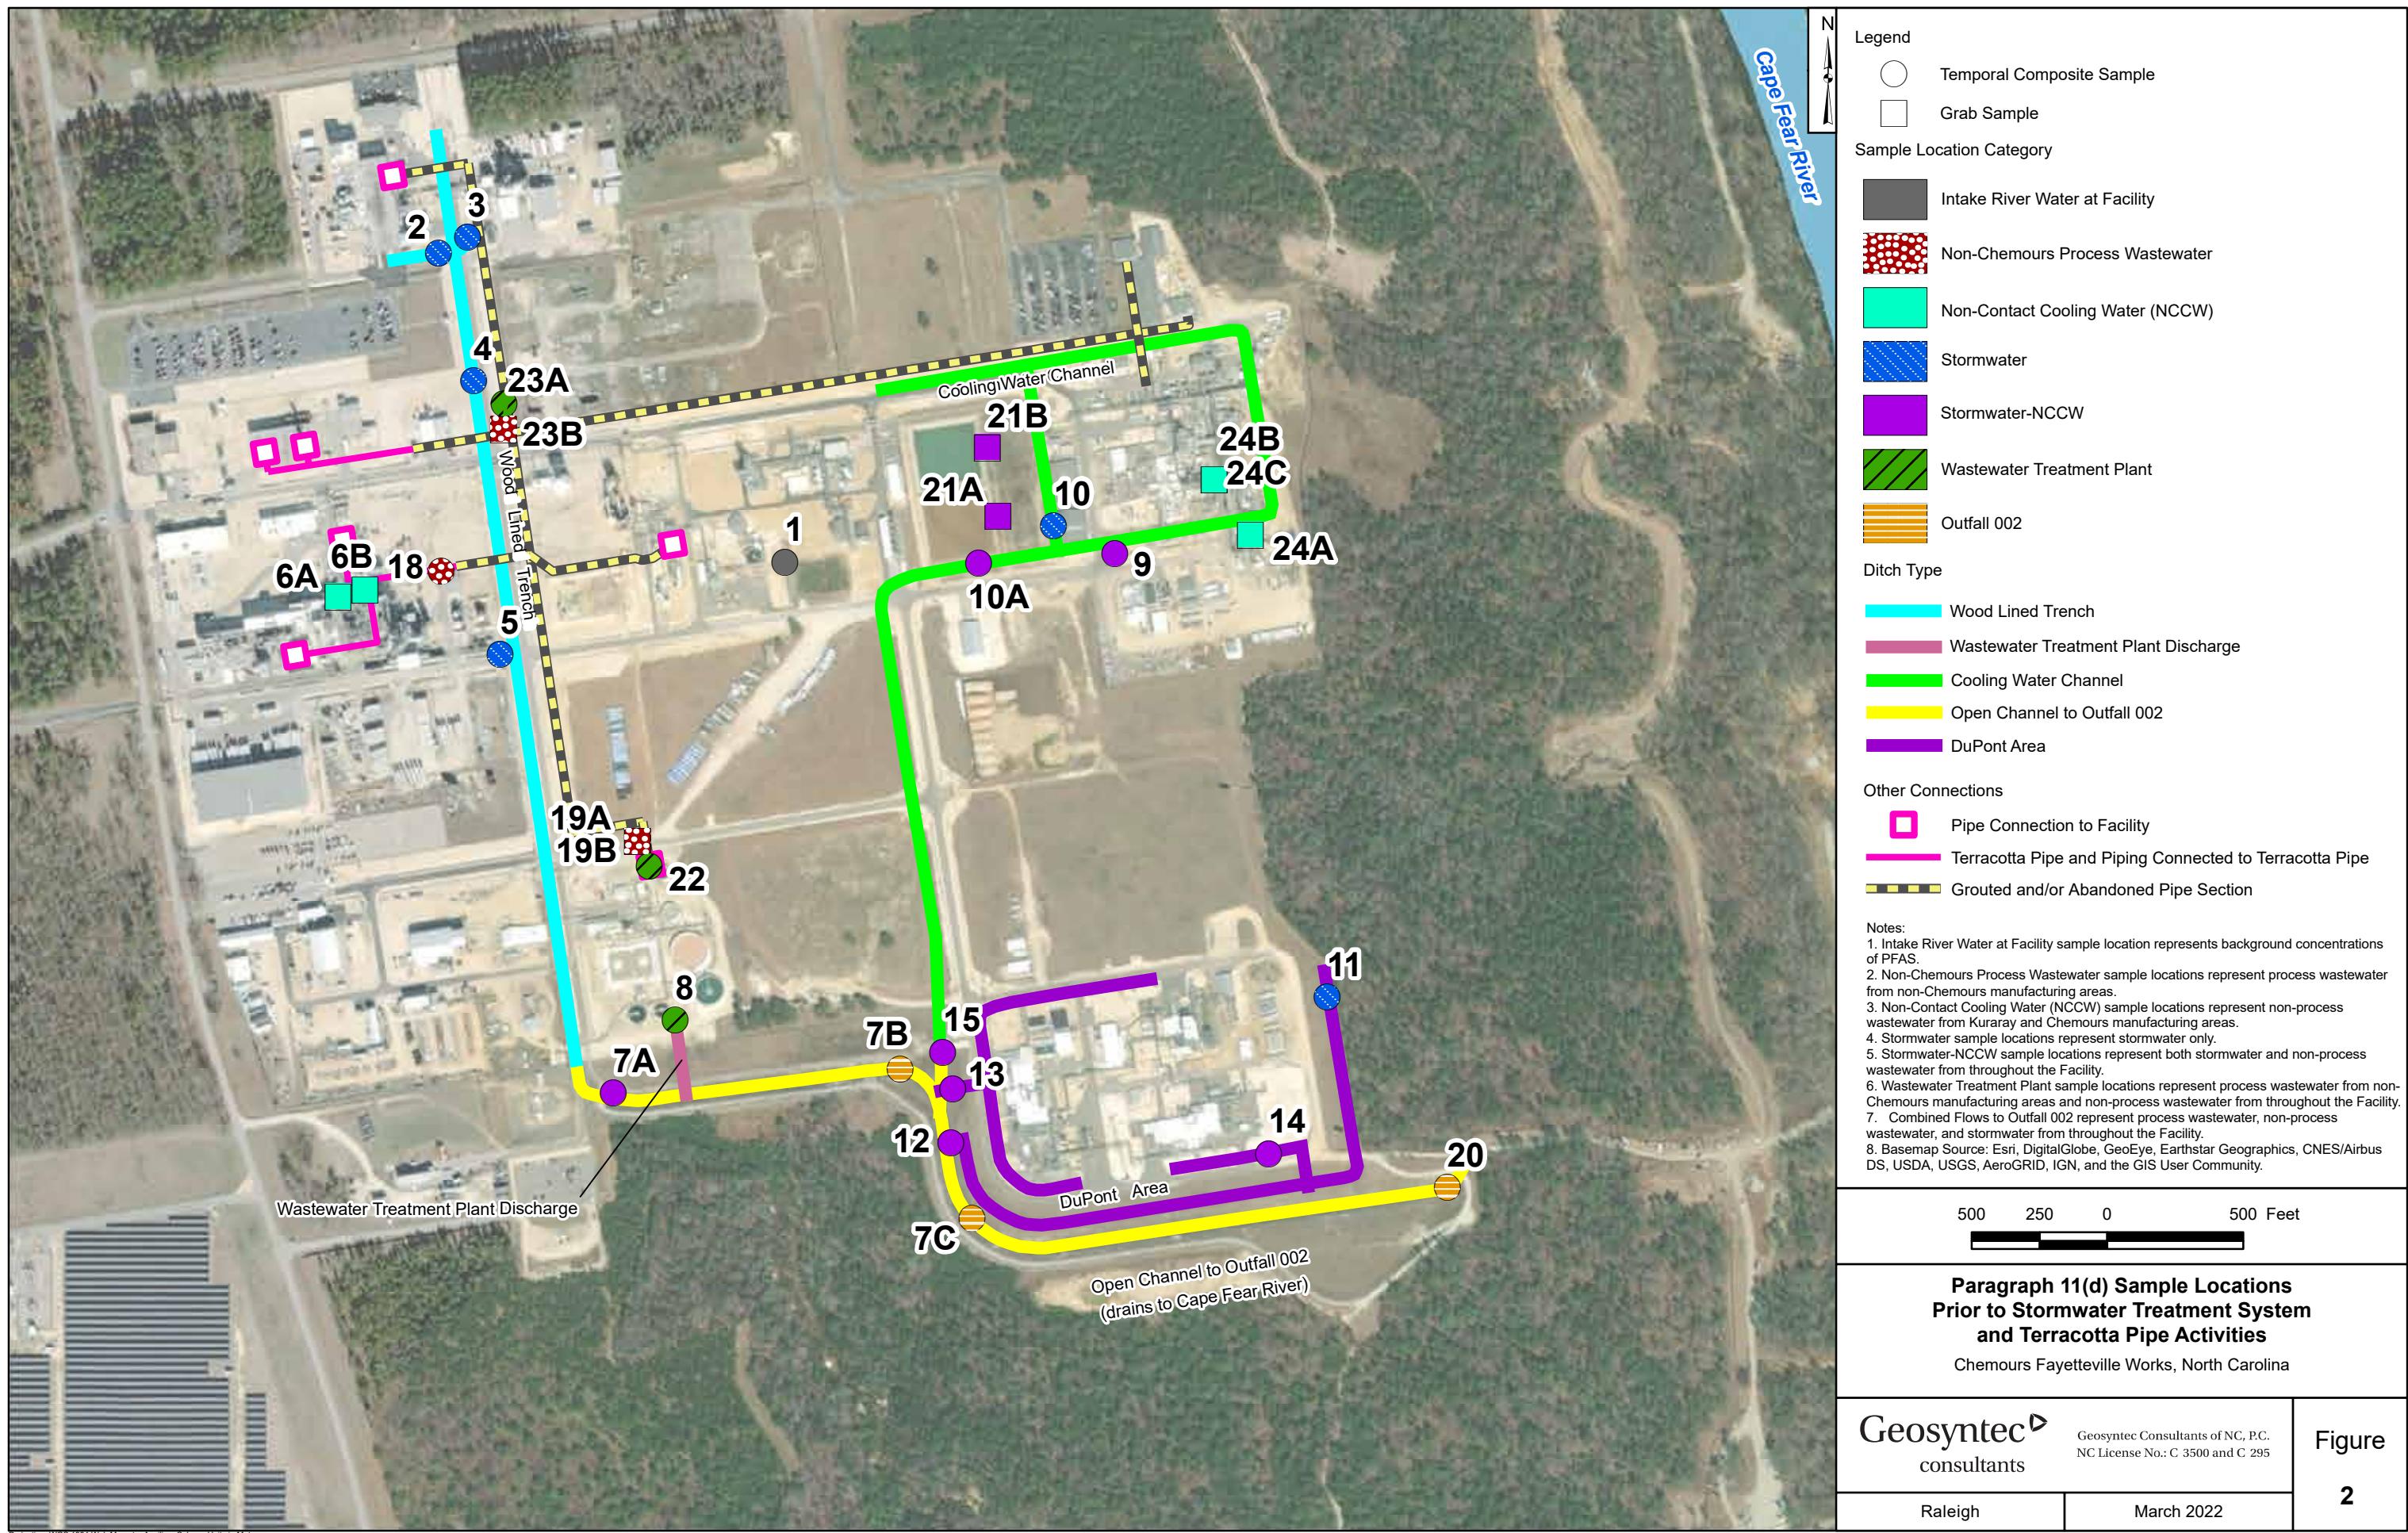

*72 hour period prior to sample collection date***Sample collection date**

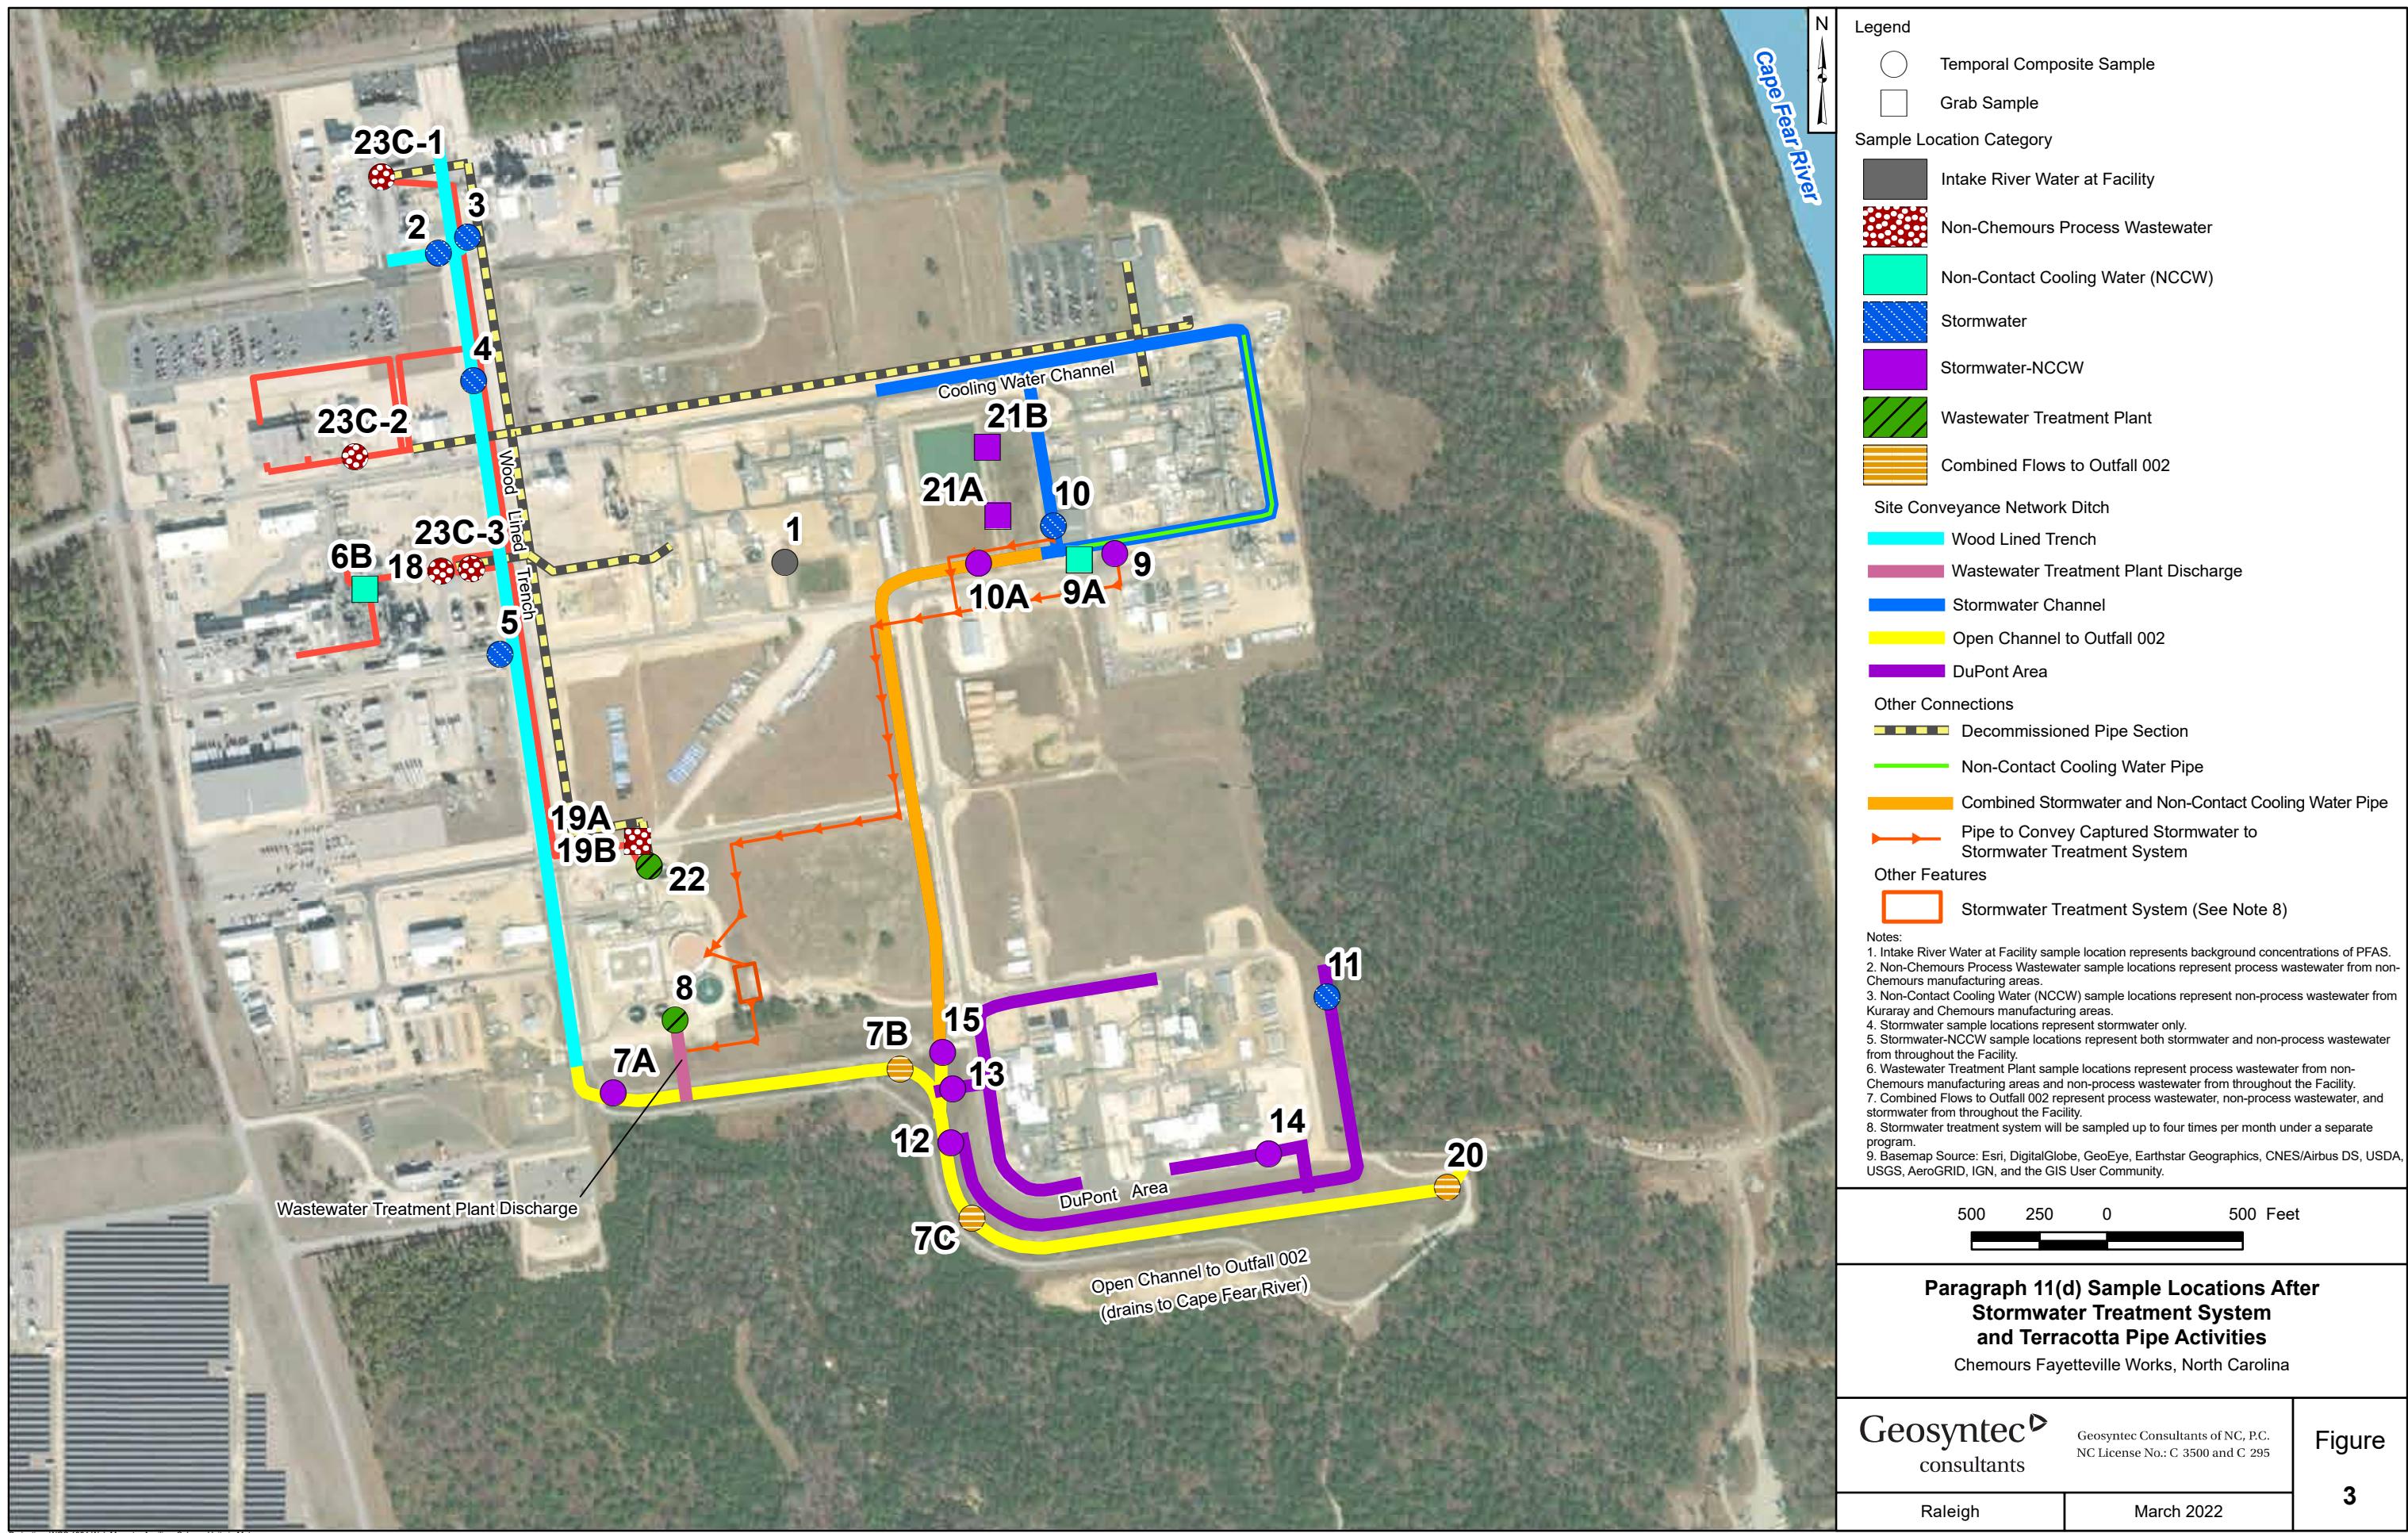

Figures

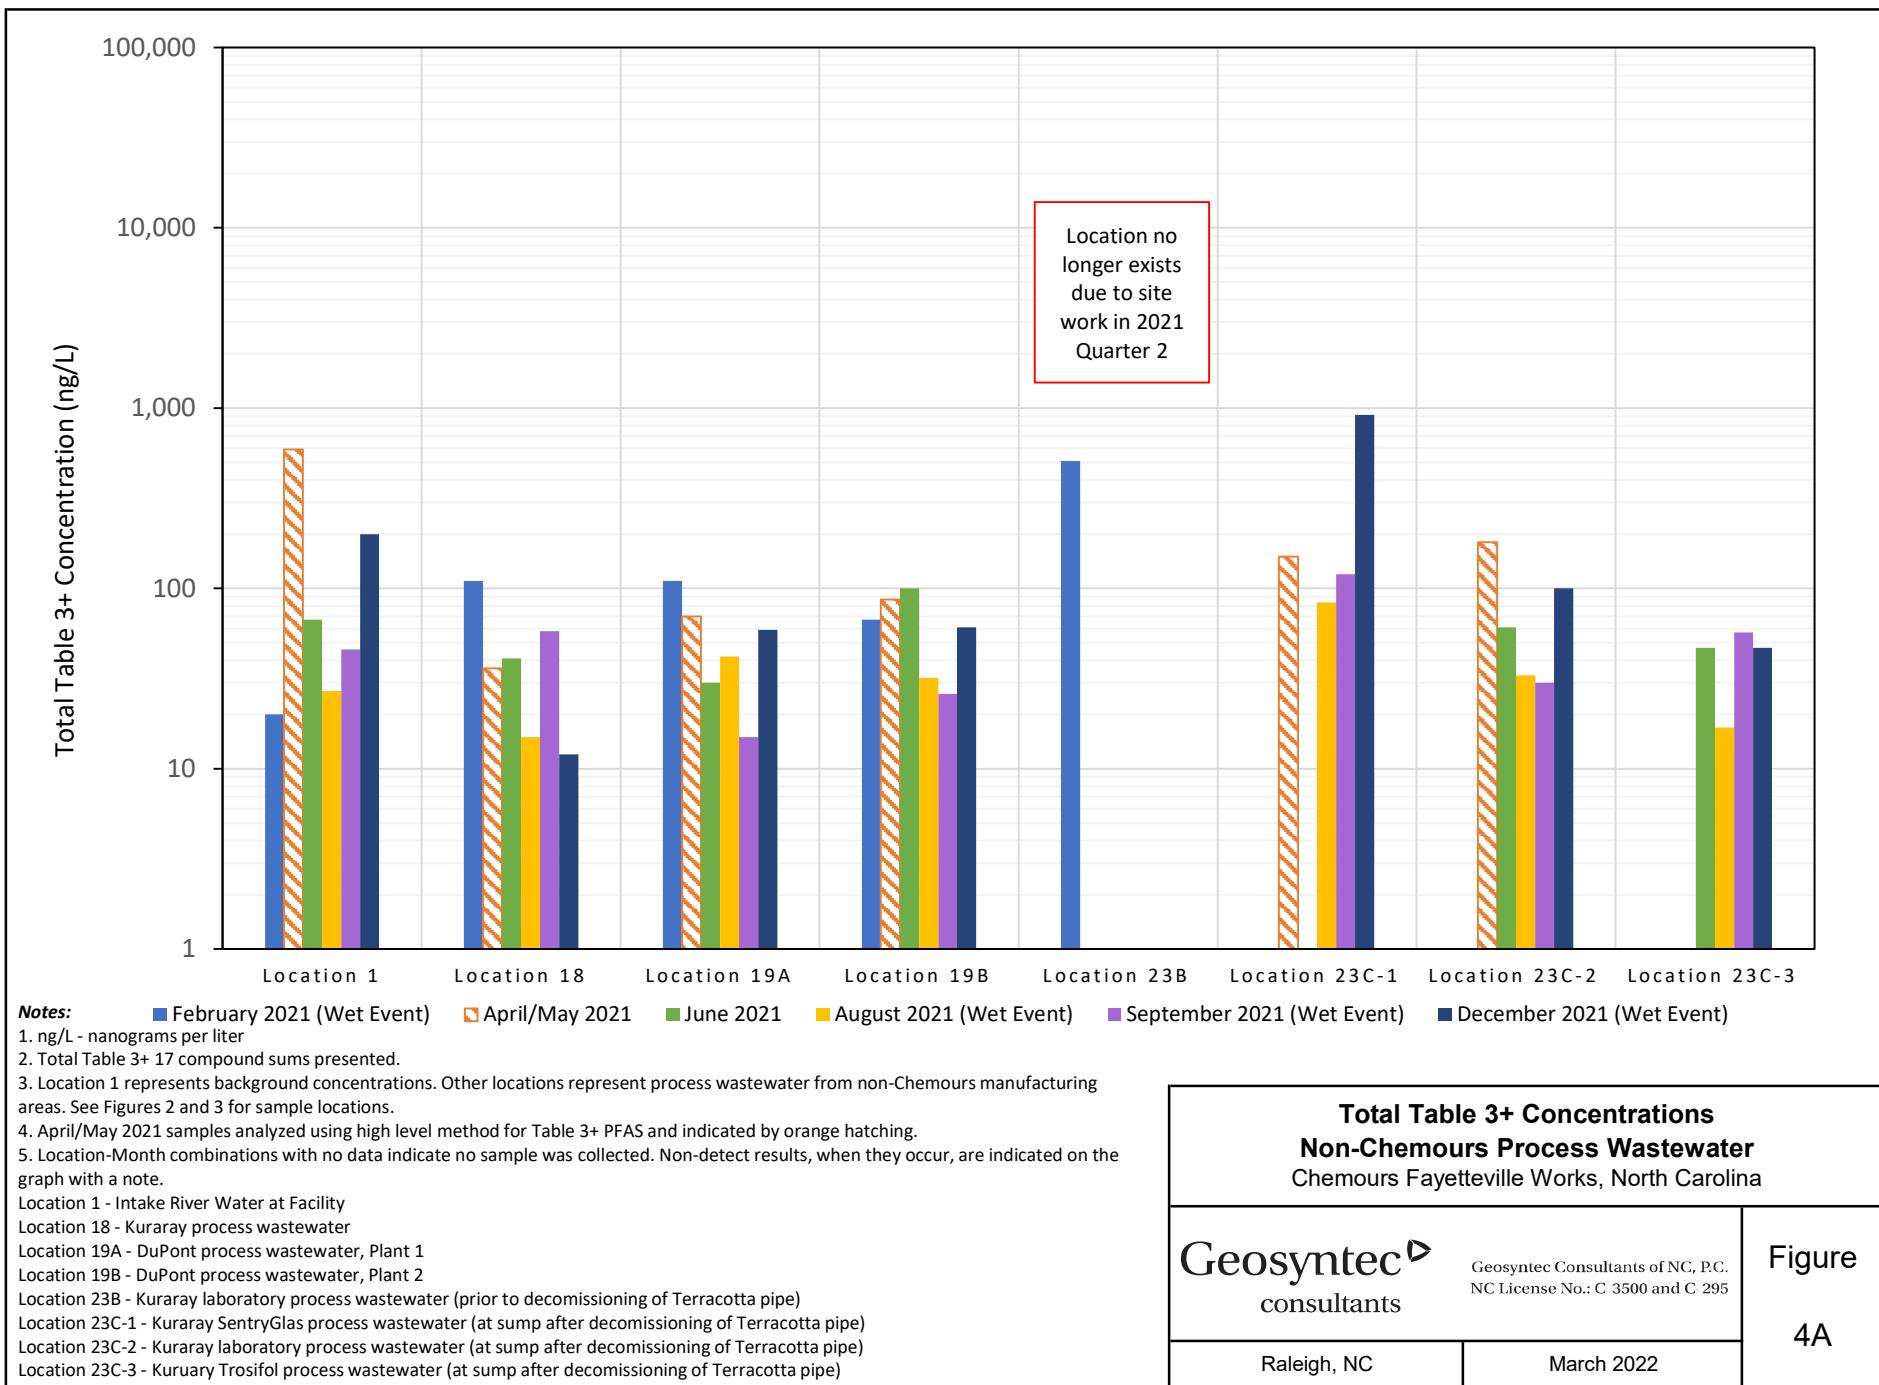

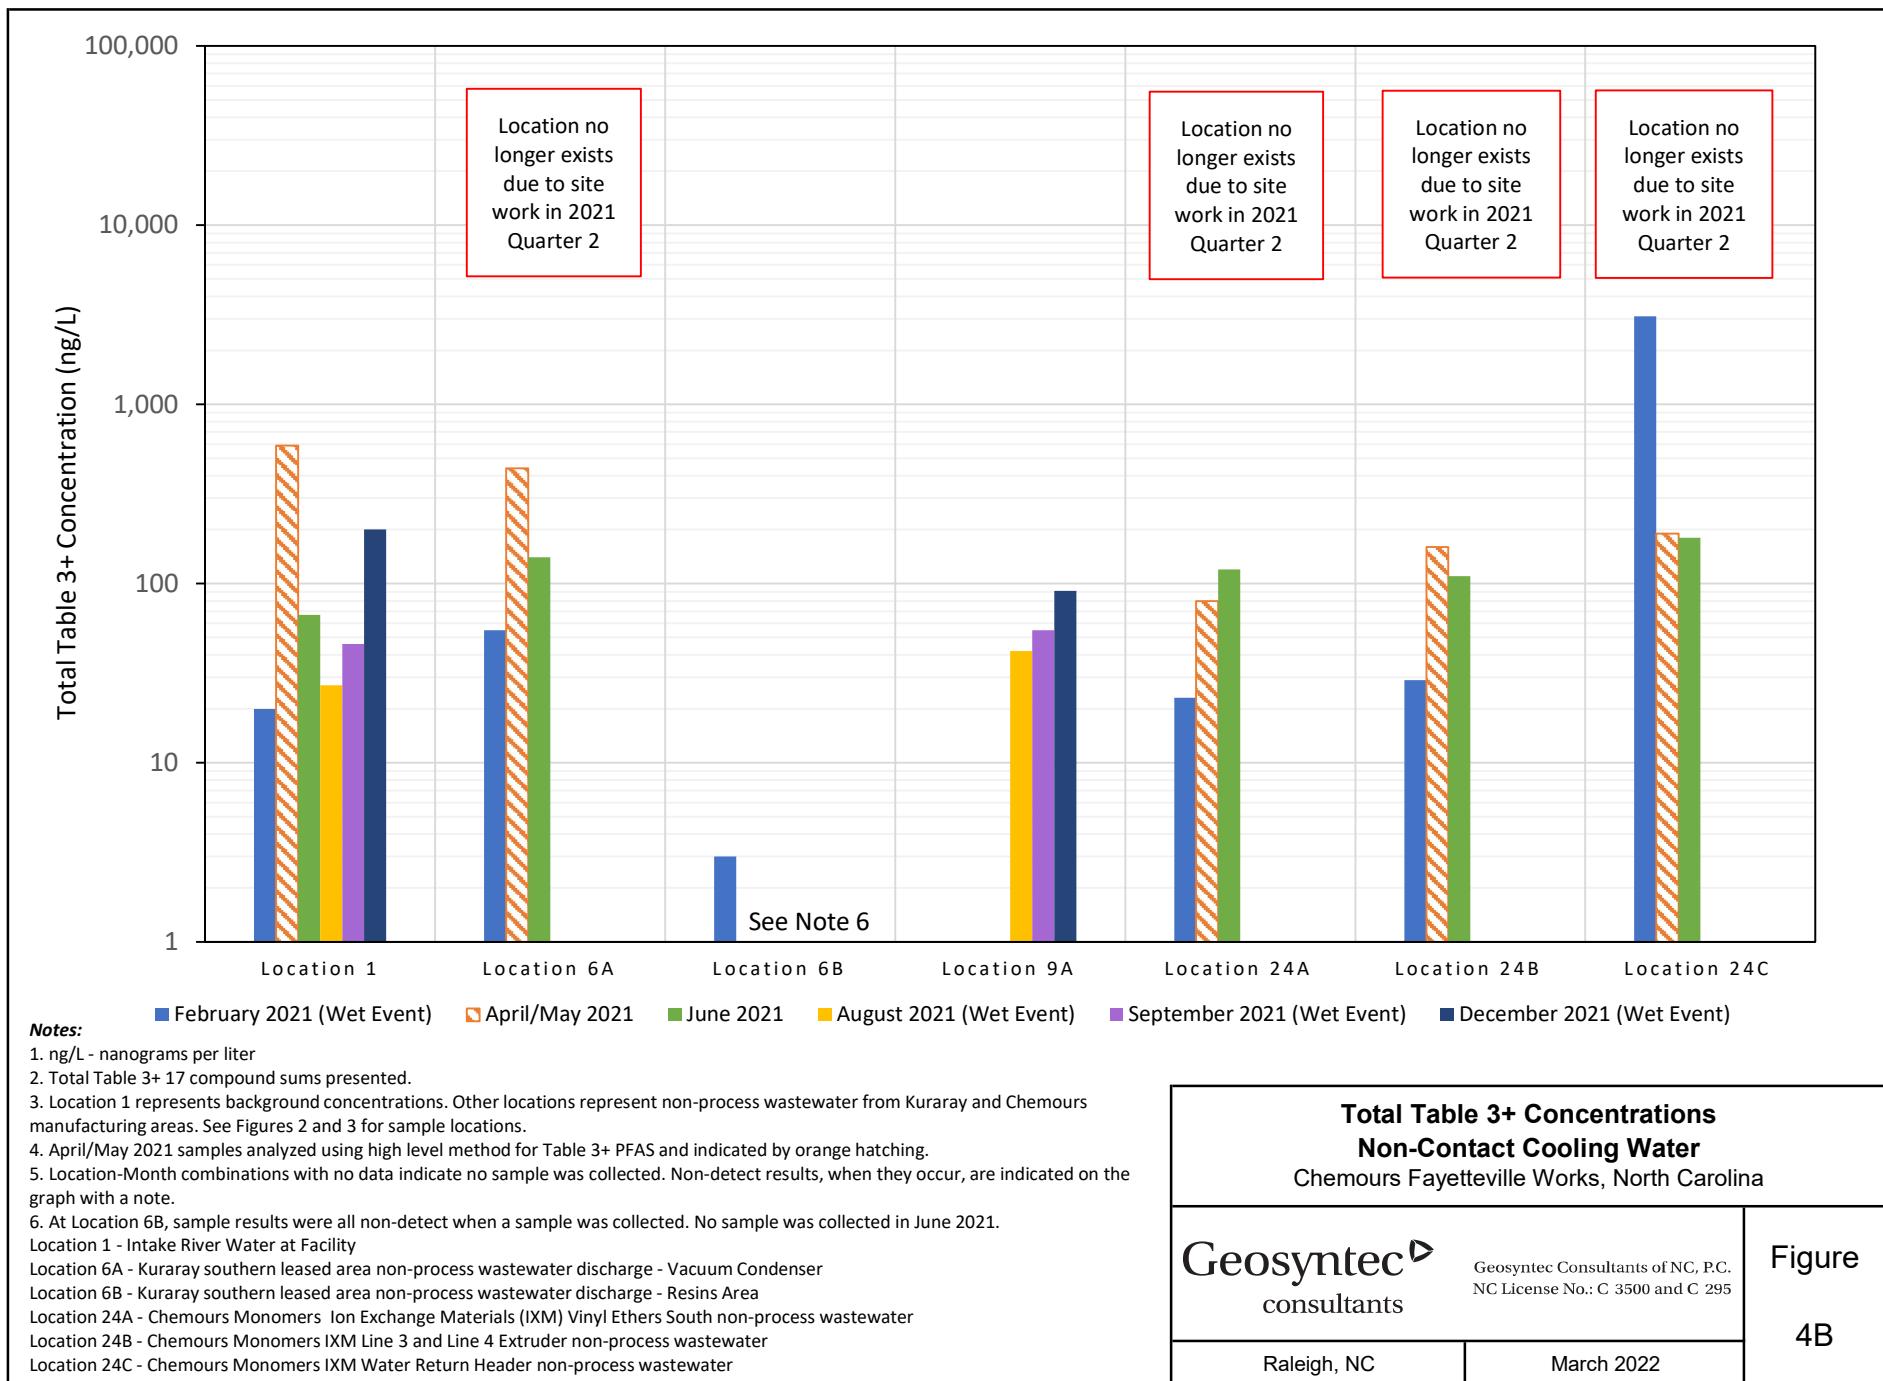

Notes:

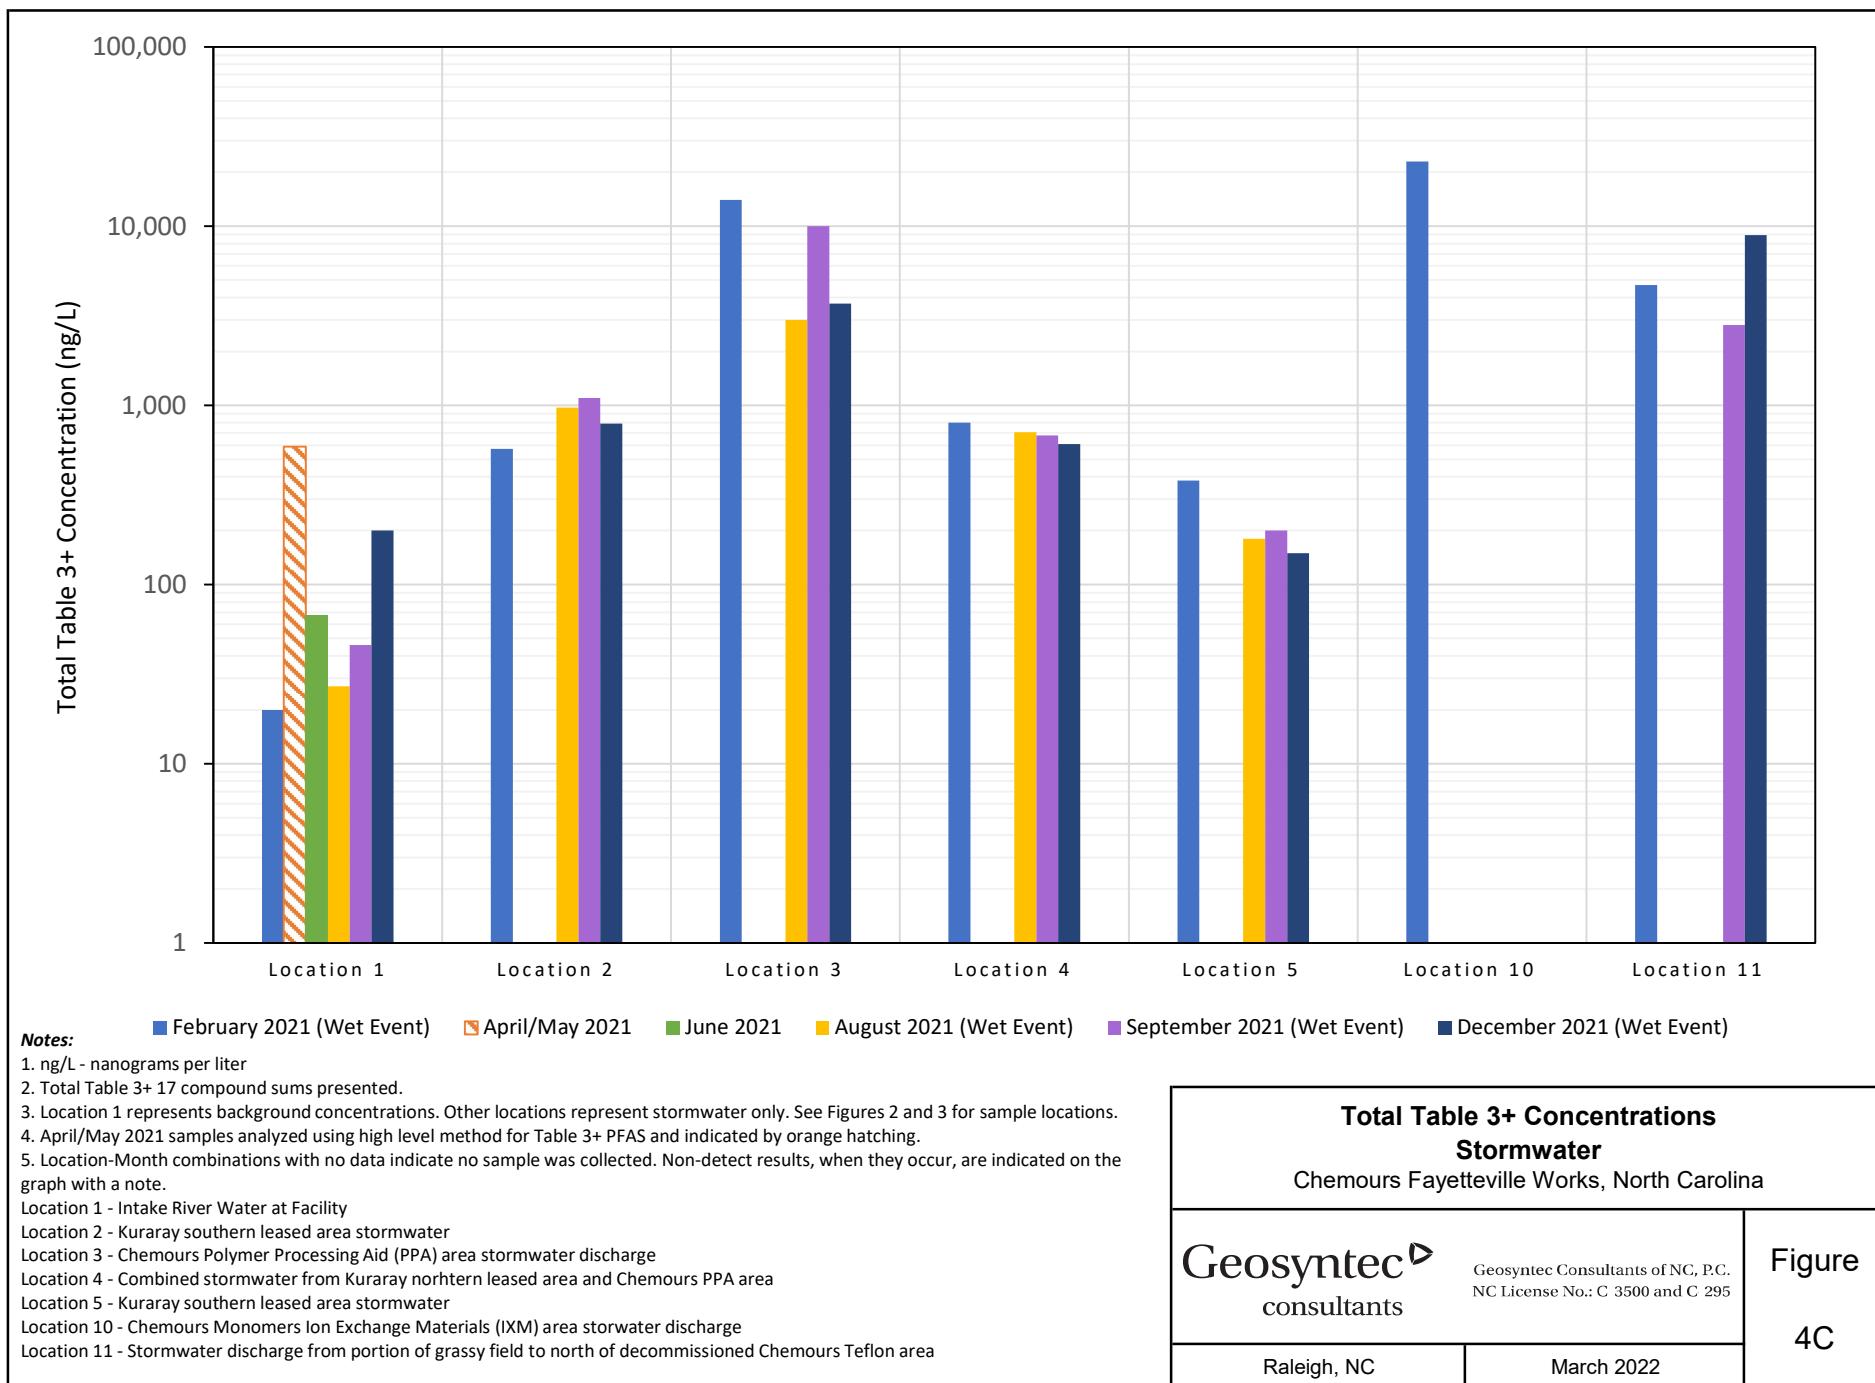

1. The outline of Cape Fear River is approximate and is based on open data from ArcGIS Online and North Carolina Department of Environmental Quality Online GIS (Major-Hydro shapefile).
2. Basemap sources: Esri, DigitalGlobe, GeoEye, Earthstar Geographics, CNES/Airbus DS, USDA, USGS, AeroGRID, IGN, and the GIS User Community.

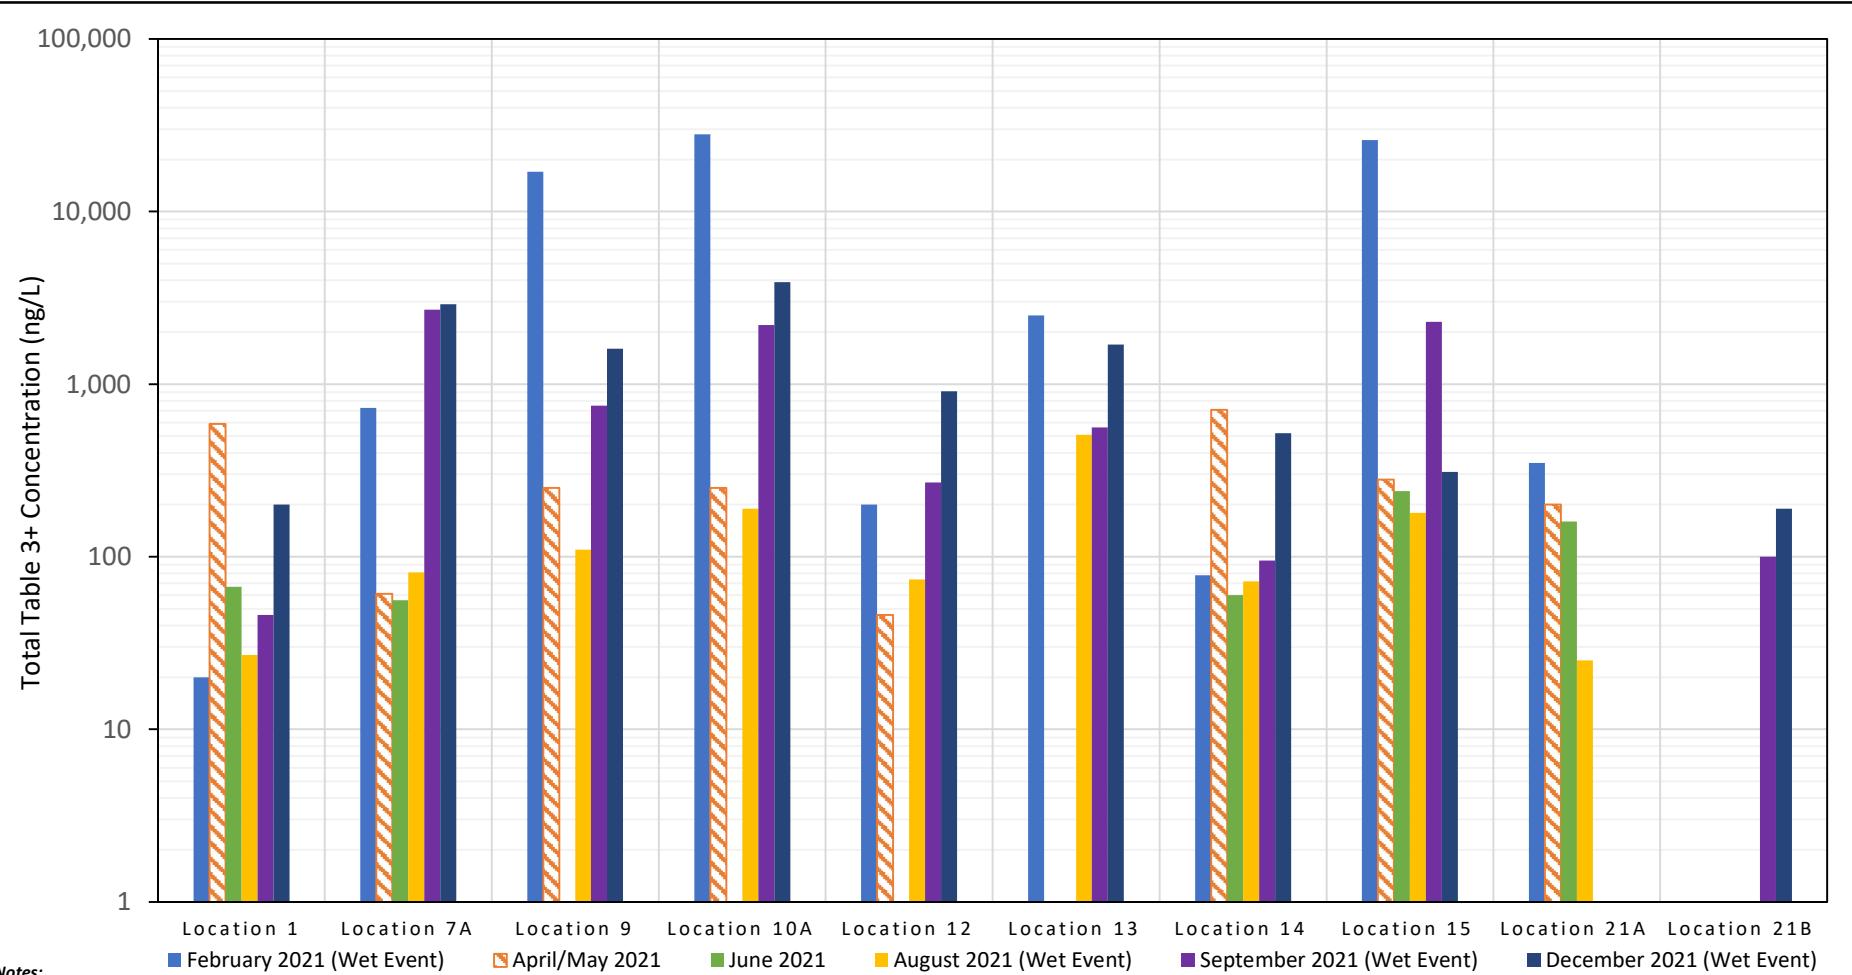

**Notes:**

1. ng/L - nanograms per liter
 2. Total Table 3+ 17 compound sums presented.
 3. Location 1 represents background concentrations. Other locations represent both stormwater and non-process wastewater from throughout the Facility. See Figures 2 and 3 for sample locations.
 4. April/May 2021 samples analyzed using high level method for Table 3+ PFAS and indicated by orange hatching.
 5. Location-Month combinations with no data indicate no sample was collected. Non-detect results, when they occur, are indicated on the graph with a note.
- Location 1 - Intake River Water at Facility
 Location 7A - Combined stormwater and non-process wastewater discharge from western portion of the Facility
 Location 9 - Combined non-process wastewater from Chemours Monomers Ion Exchange Materials (IXM) area and stormwater discharge from Vinyl Ethers South and Vinyl Ethers North
 Location 10A - Combined Chemours Monomers IXM non-process wastewater and stormwater discharge
 Location 12 - DuPont area southern drainage ditch stormwater discharge and NCCW
 Location 13 - DuPont area northern drainage ditch stormwater discharge and NCCW
 Location 14 - DuPont area southeast stormwater and NCCW discharge
 Location 15 - Combined stormwater and NCCW discharge from eastern portion of the Facility
 Location 21A - Sediment Basin South
 Location 21B - Sediment Basin North

Notes:

1 - Total Table 3+ was calculated including J qualified data but not non-detect data. The total Table 3+ sum is rounded to two significant figures.

2 - Total Table 3+ (17 Compounds) does not include R-PSDA, Hydrolyzed PSDA and R-EVE.

Bold - Analyte detected above associated reporting limit.

J - Analyte detected. Reported value may not be accurate or precise.

UJ - Analyte not detected. Reporting limit may not be accurate or precise

QA/QC - Quality assurance/ quality control

SOP - standard operating procedure

< - Analyte not detected above associated reporting limit.

ND - No Table 3+ compounds were detected above their associated reporting limits.

Notes:

°C - degrees Celsius

mg/L - milligrams per liter

mS/cm - millSiemens per centimeter

mV - millivolt

NTU - nephelometric turbidity units

ORP - oxidation reduction potential

-- - Field parameter not recorded

Field parameters for the temporal composite samples were collected during sampling directly from the water stream only.

ADQM Data Review Checklist

Item	Description	Yes	No*	Not Applicable (NA)*	DVM Narrative Report	Laboratory Report	Exception Report (ER) #
A	Did samples meet laboratory acceptability requirements upon receipt (i.e., intact, within temperature, properly preserved, and no headspace where applicable)?	X					
B	Were samples received by the laboratory in agreement with the associated chain of custody?	X					
C	Was the chain of custody properly completed by the laboratory and/or field team?	X					
D	Were samples prepped/analyzed by the laboratory within method holding times?		X		X	X	
E	Were QA/QC criteria met by the laboratory (method blanks, LCSs/LCSDs, MSs/MSDs, PDSs, SDs, duplicates/replicates, surrogates, total/dissolved differences/RPDs, sample results within calibration range)?		X		X	X	
F	Were detections in field/equipment/trip blanks at levels not requiring sample data qualification?	X					
G	Were all data usable and not R qualified?	X					
ER#	Description						
Other QA/QC Items to Note:							

* See DVM Narrative Report, Laboratory Report, and/or ER # for further details as indicated.

The electronic data submitted for this project were reviewed via the Data Verification Module (DVM) process. Overall, the data are acceptable for use without qualification, except as noted on the attached DVM Narrative Report.

The lab reports due to a large page count are stored on a network shared drive and are available to be posted on external shared drives, or on a flash drive.

Data Verification Module (DVM)

The DVM is an internal review process used by the ADQM group to assist with the determination of data usability. The electronic data deliverables received from the laboratory are loaded into the Locus EIM™ database and processed through a series of data quality checks, which are a combination of software, Locus EIM™ database Data Verification Module (DVM), and manual reviewer evaluations. The data are evaluated against the following data usability checks:

- Field and laboratory blank contamination
- US EPA hold time criteria
- Missing Quality Control (QC) samples
- Matrix spike (MS)/matrix spike duplicate (MSD) recoveries and the relative percent differences (RPDs) between these spikes
- Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) recoveries and the RPD between these spikes
- Surrogate spike recoveries for organic analyses
- Difference/RPD between field duplicate sample pairs
- RPD between laboratory replicates for inorganic analyses
- Difference/percent difference between total and dissolved sample pairs

There are two qualifier fields in EIM:

Laboratory Qualifier is the qualifier assigned by the laboratory and may not reflect the usability of the data. This qualifier may have many different meanings and can vary between labs and over time within the same lab. Please refer to the laboratory report for a description of the laboratory qualifiers. As they are laboratory descriptors they are not to be used when evaluating the data.

Validation Qualifier is the 3rd party formal validation qualifier if this was performed. Otherwise this field contains the qualifier resulting from the ADQM DVM review process. This qualifier assesses the usability of the data and may not equal the laboratory qualifier. The DVM applies the following data evaluation qualifiers to analysis results, as warranted:

Qualifier	Definition
B	Not detected substantially above the level reported in the laboratory or field blanks.
R	Unusable result. Analyte may or may not be present in the sample.
J	Analyte present. Reported value may not be accurate or precise.
UJ	Not detected. Reporting limit may not be accurate or precise.

The **Validation Status Code** field is set to “DVM” if the ADQM DVM process has been performed. If the DVM has not been run, the field will be blank.

If the DVM has been run (**Validation Status Code** equals “DVM”), use the **Validation Qualifier**.

If the data have been validated by a third party, the field “**Validated By**” will be set to the validator (e.g., ESI for Environmental Standards, Inc.).

DVM Narrative Report**Site:** Fayetteville**Sampling Program:** Stormwater Sampling 8/21**Validation Options:** LABSTATS**Validation Reason**

Only one surrogate has relative percent recovery (RPR) values outside control limits and the parameter is a PFC (Nondetects).

Field Sample ID	Date Sampled	Lab Sample ID	Analyte	Result	Units	Type	MDL	PQL	Validation Qualifier	Analytical Method	Pre-prep	Prep

Validation Reason Associated MS and/or MSD analysis had relative percent recovery (RPR) values higher than the upper control limit. The reported result may be biased high.

Site: Fayetteville

Sampling Program: Stormwater Sampling 8/21

Validation Options: LABSTATS

Validation Reason

Uncertainty around the analysis of R-PSDA, Hydrolyzed PSDA and R-EVE; J-qualifier added to all detects in the data set, even if there was no matrix spike analyzed for that particular sample.

Site: Fayetteville

Sampling Program: Stormwater Sampling 8/21

Validation Options: LABSTATS

Validation Reason	Uncertainty around the analysis of R-PSDA, Hydrolyzed PSDA and R-EVE; J-qualifier added to all detects in the data set, even if there was no matrix spike analyzed for that particular sample.

Site: Fayetteville

Sampling Program: Stormwater Sampling 8/21

Validation Options: LABSTATS

Validation Reason

Associated MS and/or MSD analysis had relative percent recovery (RPR) values less than the lower control limit but above the rejection limit. The reported result may be biased low.

ADQM Data Review Checklist

Item	Description	Yes	No*	Not Applicable (NA)*	DVM Narrative Report	Laboratory Report	Exception Report (ER) #
A	Did samples meet laboratory acceptability requirements upon receipt (i.e., intact, within temperature, properly preserved, and no headspace where applicable)?	X					
B	Were samples received by the laboratory in agreement with the associated chain of custody?	X					
C	Was the chain of custody properly completed by the laboratory and/or field team?	X					
D	Were samples prepped/analyzed by the laboratory within method holding times?		X		X	X	
E	Were QA/QC criteria met by the laboratory (method blanks, LCSs/LCSDs, MSs/MSDs, PDSs, SDs, duplicates/replicates, surrogates, total/dissolved differences/RPDs, sample results within calibration range)?		X		X	X	
F	Were detections in field/equipment/trip blanks at levels not requiring sample data qualification?	X					
G	Were all data usable and not R qualified?	X					
ER#	Description						
Other QA/QC Items to Note:							

* See DVM Narrative Report, Laboratory Report, and/or ER # for further details as indicated.

The electronic data submitted for this project were reviewed via the Data Verification Module (DVM) process. Overall, the data are acceptable for use without qualification, except as noted on the attached DVM Narrative Report.

The lab reports due to a large page count are stored on a network shared drive and are available to be posted on external shared drives, or on a flash drive.

Data Verification Module (DVM)

The DVM is an internal review process used by the ADQM group to assist with the determination of data usability. The electronic data deliverables received from the laboratory are loaded into the Locus EIM™ database and processed through a series of data quality checks, which are a combination of software, Locus EIM™ database Data Verification Module (DVM), and manual reviewer evaluations. The data are evaluated against the following data usability checks:

- Field and laboratory blank contamination
- US EPA hold time criteria
- Missing Quality Control (QC) samples
- Matrix spike (MS)/matrix spike duplicate (MSD) recoveries and the relative percent differences (RPDs) between these spikes
- Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) recoveries and the RPD between these spikes
- Surrogate spike recoveries for organic analyses
- Difference/RPD between field duplicate sample pairs
- RPD between laboratory replicates for inorganic analyses
- Difference/percent difference between total and dissolved sample pairs

There are two qualifier fields in EIM:

Laboratory Qualifier is the qualifier assigned by the laboratory and may not reflect the usability of the data. This qualifier may have many different meanings and can vary between labs and over time within the same lab. Please refer to the laboratory report for a description of the laboratory qualifiers. As they are laboratory descriptors they are not to be used when evaluating the data.

Validation Qualifier is the 3rd party formal validation qualifier if this was performed. Otherwise this field contains the qualifier resulting from the ADQM DVM review process. This qualifier assesses the usability of the data and may not equal the laboratory qualifier. The DVM applies the following data evaluation qualifiers to analysis results, as warranted:

Qualifier	Definition
B	Not detected substantially above the level reported in the laboratory or field blanks.
R	Unusable result. Analyte may or may not be present in the sample.
J	Analyte present. Reported value may not be accurate or precise.
UJ	Not detected. Reporting limit may not be accurate or precise.

The **Validation Status Code** field is set to “DVM” if the ADQM DVM process has been performed. If the DVM has not been run, the field will be blank.

If the DVM has been run (**Validation Status Code** equals “DVM”), use the **Validation Qualifier**.

If the data have been validated by a third party, the field “**Validated By**” will be set to the validator (e.g., ESI for Environmental Standards, Inc.).

DVM Narrative Report**Site:** Fayetteville**Sampling Program:** Stormwater Sampling 9/21**Validation Options:** LABSTATS**Validation Reason**

The preparation hold time for this sample was exceeded by a factor of 2. The reported result may be biased low.

Site: Fayetteville

Sampling Program: Stormwater Sampling 9/21

Validation Options: LABSTATS

Validation Reason

Associated MS and/or MSD analysis had relative percent recovery (RPR) values less than the lower control limit. The actual detection limits may be higher than reported.

Site: Fayetteville**Sampling Program:** Stormwater Sampling 9/21**Validation Options:** LABSTATS**Validation Reason**

Quality review criteria exceeded between the REP (laboratory replicate) and parent sample. The reported result may be imprecise.

Field Sample ID	Date Sampled Lab Sample ID	Analyte	Result	Units	Type	MDL	PQL	Validation Qualifier	Analytical Method	Pre-prep	Prep
STW-LOC-19A-092321	09/23/2021 320-79498-3	Perfluoropentanoic Acid (trial)	0.0099	UG/L	PQL		0.0020	J	537 Modified		3535_PFC

Site: Fayetteville

Sampling Program: Stormwater Sampling 9/21

Validation Options: LABSTATS

Validation Reason

Uncertainty around the analysis of R-PSDA, Hydrolyzed PSDA and R-EVE; J-qualifier added to all detects in the data set, even if there was no matrix spike analyzed for that particular sample.

ADQM Data Review Checklist

Item	Description	Yes	No*	Not Applicable (NA)*	DVM Narrative Report	Laboratory Report	Exception Report (ER) #
A	Did samples meet laboratory acceptability requirements upon receipt (i.e., intact, within temperature, properly preserved, and no headspace where applicable)?	X					
B	Were samples received by the laboratory in agreement with the associated chain of custody?	X					
C	Was the chain of custody properly completed by the laboratory and/or field team?	X					
D	Were samples prepped/analyzed by the laboratory within method holding times?		X		X	X	
E	Were QA/QC criteria met by the laboratory (method blanks, LCSs/LCSDs, MSs/MSDs, PDSs, SDs, duplicates/replicates, surrogates, total/dissolved differences/RPDs, sample results within calibration range)?		X		X	X	
F	Were detections in field/equipment/trip blanks at levels not requiring sample data qualification?	X					
G	Were all data usable and not R qualified?	X					
ER#	Description						
Other QA/QC Items to Note:							

* See DVM Narrative Report, Laboratory Report, and/or ER # for further details as indicated.

The electronic data submitted for this project were reviewed via the Data Verification Module (DVM) process. Overall, the data are acceptable for use without qualification, except as noted on the attached DVM Narrative Report.

The lab reports due to a large page count are stored on a network shared drive and are available to be posted on external shared drives, or on a flash drive.

Data Verification Module (DVM)

The DVM is an internal review process used by the ADQM group to assist with the determination of data usability. The electronic data deliverables received from the laboratory are loaded into the Locus EIM™ database and processed through a series of data quality checks, which are a combination of software, Locus EIM™ database Data Verification Module (DVM), and manual reviewer evaluations. The data are evaluated against the following data usability checks:

- Field and laboratory blank contamination
- US EPA hold time criteria
- Missing Quality Control (QC) samples
- Matrix spike (MS)/matrix spike duplicate (MSD) recoveries and the relative percent differences (RPDs) between these spikes
- Laboratory control sample (LCS)/laboratory control sample duplicate (LCSD) recoveries and the RPD between these spikes
- Surrogate spike recoveries for organic analyses
- Difference/RPD between field duplicate sample pairs
- RPD between laboratory replicates for inorganic analyses
- Difference/percent difference between total and dissolved sample pairs

There are two qualifier fields in EIM:

Laboratory Qualifier is the qualifier assigned by the laboratory and may not reflect the usability of the data. This qualifier may have many different meanings and can vary between labs and over time within the same lab. Please refer to the laboratory report for a description of the laboratory qualifiers. As they are laboratory descriptors they are not to be used when evaluating the data.

Validation Qualifier is the 3rd party formal validation qualifier if this was performed. Otherwise this field contains the qualifier resulting from the ADQM DVM review process. This qualifier assesses the usability of the data and may not equal the laboratory qualifier. The DVM applies the following data evaluation qualifiers to analysis results, as warranted:

Qualifier	Definition
B	Not detected substantially above the level reported in the laboratory or field blanks.
R	Unusable result. Analyte may or may not be present in the sample.
J	Analyte present. Reported value may not be accurate or precise.
UJ	Not detected. Reporting limit may not be accurate or precise.

The **Validation Status Code** field is set to “DVM” if the ADQM DVM process has been performed. If the DVM has not been run, the field will be blank.

If the DVM has been run (**Validation Status Code** equals “DVM”), use the **Validation Qualifier**.

If the data have been validated by a third party, the field “**Validated By**” will be set to the validator (e.g., ESI for Environmental Standards, Inc.).

DVM Narrative Report**Site:** Fayetteville**Sampling Program:** Stormwater Sampling 12/21**Validation Options:** LABSTATS**Validation Reason**

Only one surrogate has relative percent recovery (RPR) values outside control limits and the parameter is a PFC (Nondetects).

Site: Fayetteville

Sampling Program: Stormwater Sampling 12/21

Validation Options: LABSTATS

Validation Reason

The analysis hold time for this sample was exceeded. The reporting limit may be biased low.

Site: Fayetteville**Sampling Program:** Stormwater Sampling 12/21**Validation Options:** LABSTATS**Validation Reason**

High relative percent difference (RPD) observed between LCS and LCSD samples. The reported result may be imprecise.

Field Sample ID	Date Sampled	Lab Sample ID	Analyte	Result	Units	Type	MDL	PQL	Validation Qualifier	Analytical Method	Pre-prep	Prep
STW-LOC-23C-1-4-121021	12/10/2021	320-82957-1	Hfpo Dimer Acid	0.042	UG/L	PQL		0.0020	J	Cl. Spec. Table 3 Compound SOP		PFAS_DI_Prep

Validation Reason

Only one surrogate has relative percent recovery (RPR) values outside control limits and the parameter is a PFC (Detects).

Field Sample ID	Date	Analyte	Result	Units	Type	MDL	PQL	Validation Qualifier	Analytical Method	Pre-prep	Prep
	Sampled Lab Sample ID

Appendix D

Field Forms

Stormwater Sampling			
Project Name:	Fayetteville Stormwater Sampling		
Samplers:	CHARLES PACE,LUKE TART		
Sampling Event:	P11 - Full		
Site:	Fayetteville Works	Date:	8/17/2021
		Time:	13:55
FIELD OBSERVATIONS			
Weather Conditions:	Cloudy and Rain	Air Temp:	83.0 degrees F
Water Flow:	Flowing	Wind Speed:	5.0 mph
Water Quality Condition:	None		
Water Clarity:	Clear (see bottom)		
Water Color:	Colorless		
Water Odor:	None		
Other Significant Observations or Unusual Occurrences:			
Flow Reading:			
SAMPLE DETAILS*			
Sample ID:	STW-LOC-1-6-081721		
QA/QC:		ALL PARAMETERS ANALYZED	
Field Filtered:	No	Table 3+ (21) LL Including HFPO-DA and PFHpA; 537 Mod (36)	
Sampling Method:	ISCO		
Sample Start Date:	08-17-2021		
Sample Start Time:	13:49		
Sample End Date:	8/17/2021	*Note: Sample start time required for grab and composite samples. Sample end time required for composite samples only.	
Sample End Time:	18:49		
Sample Date:	8/17/2021		
Sample Time:	18:49		
Number of Cycles:	12		
Total ISCO Run Time Hours:	6		
FIELD MEASUREMENTS**
