Chemours Receives Air Permit for Thermal Oxidizer Emissions Control Unit
Innovative Technology Raises the Bar for Corporate Responsibility Commitments

The Chemours Company received the North Carolina Division of Air Quality (NCDAQ) Title V Air Quality Permit authorizing construction and operation of its thermal oxidizer emissions control unit at its Fayetteville Works site. The permit applies to the company’s thermal oxidizer emissions control unit and the two carbon adsorption units already in place at the site.

“Reducing our overall air emissions by 99% from 2017 baseline levels will have positive benefits for the environment and our community,” said Brian Long, plant manager of the Chemours Fayetteville Works facility. “We have set very high standards for manufacturing operations at our site, while making significant progress toward achieving our emission control goals. We are focused on not just meeting requirements, but exceeding expectations.”

The carbon adsorption units already in place and operational at the site have led to a greater than 93.9% reduction in air emissions from 2017 levels. The Title V air permit reinforces technical requirements of the consent order agreement regarding air emissions reductions. The company intends to have the thermal oxidizer operational by December 31, 2019, which will bring the overall reduction in air emissions to 99% or greater for all GenX and PFAS compounds.
